

Coastal Navigation Pt. 1

- Introduction to Navigation
- Coordinate Systems
- Nautical Charts
- Aids to Navigation
- The Magnetic Compass

Coastal Navigation Pt. 2

- Tides
- Obtaining a Fix
- Dead Reckoning
- Navigation Rules
- Electronic Instruments

A nautical chart showing depth contours, a compass rose, and various navigational markers. The chart is overlaid with text defining navigation concepts.

What Is Navigation?

Navigation: Determination of one's position, and velocity. (Where are you?)

Guidance: Determination of the desired path to a destination. (Where are you going? How will you get there?)

Collision Avoidance: Getting there safely.

Types of Marine Navigation

- **Dead Reckoning**

Starting from a known location, track your position based on the speed and direction your vessel travels over measured periods of time.

- **Piloting**

Navigating by sight in restricted waters using landmarks such as geographic features and other aids to navigation.

- **Celestial Navigation**

Determining your position based on the positions of the sun, moon, stars, and other celestial objects, usually measured with a sextant.

Types of Marine Navigation

- Radio Navigation

Determining your position based on radio signals (e.g. RDF, LORAN).

- Radar Navigation

Using radar to determine direction and distance to nearby objects.

- Inertial Navigation

Use of accelerometers and gyroscopes to keep an electronic dead reckoning. Not used much on sailboats.

- Satellite Navigation

Use of satellite based electronic systems; primarily GPS.

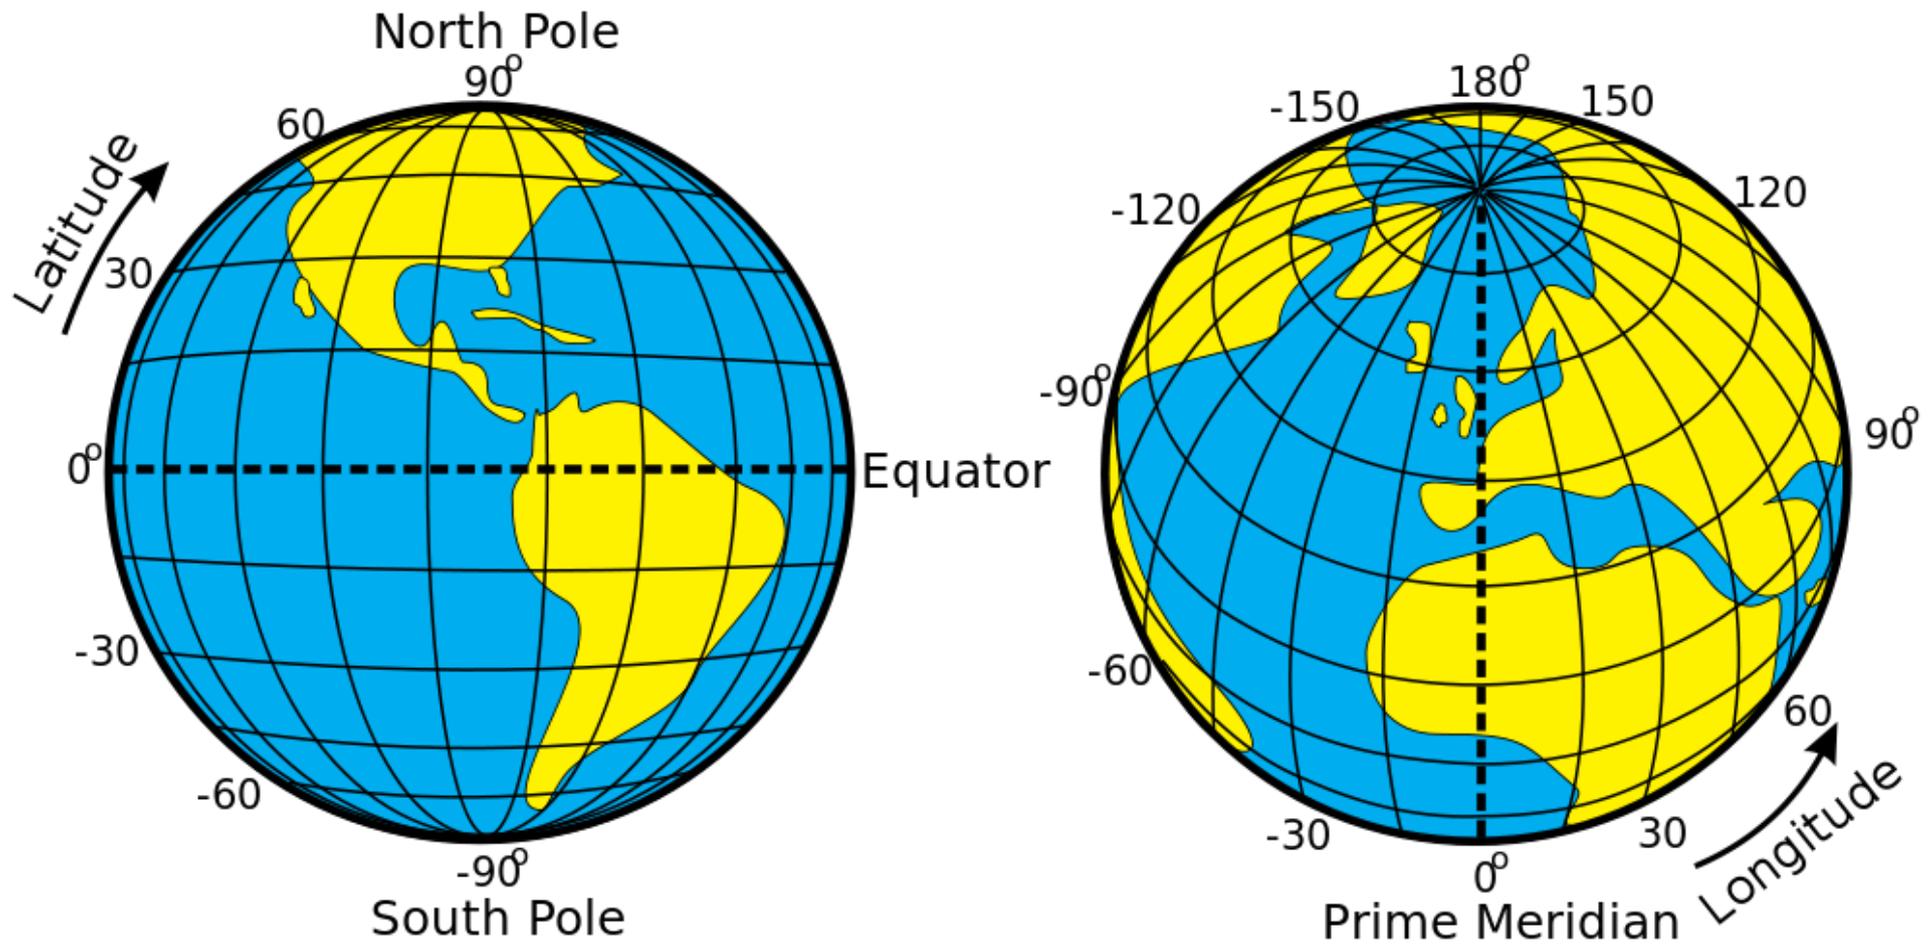

Marine Navigation

The Navigation Rules... expect prudent mariners to avail themselves of *all available means appropriate...* as to make *full appraisal of the situation.*

WARNING

The prudent mariner will not rely solely on any single aid to navigation, particularly on floating aids.

Latitude and Longitude

Parallels of **Latitude**: Position **North** or **South** of Equator

Meridians of **Longitude**: Position **East** or **West** of Prime Meridian

(Greenwich)

Specifying Latitude and Longitude

360 degrees ($^{\circ}$) in a circle
60 minutes ($'$) in 1 degree
60 seconds ($''$) in 1 minute

North & East: positive
South & West: negative

Coordinates of MIT Sailing Pavilion:

$42^{\circ} 21' 30.4''$ N, $71^{\circ} 5' 15.6''$ W
 $42^{\circ} 21.507'$ N, $71^{\circ} 5.260'$ W
 42.35845° N, 71.08776° W
 42.35845 , -71.08776

Latitude should be written first

Specifying Latitude and Longitude

360 degrees ($^{\circ}$) in a circle
60 minutes ($'$) in 1 degree
60 seconds ($''$) in 1 minute

North & East: positive
South & West: negative

Coordinates of MIT Sailing Pavilion:

42° 21' 30.4" N, 71° 5' 15.6" W

42° 21.507' N, 71° 5.260' W

42.35845° N, 71.08776° W

42.35845, -71.08776

When specifying coordinates for use in navigation, use degrees and minutes. Be sure to include at least one decimal place for the minutes.

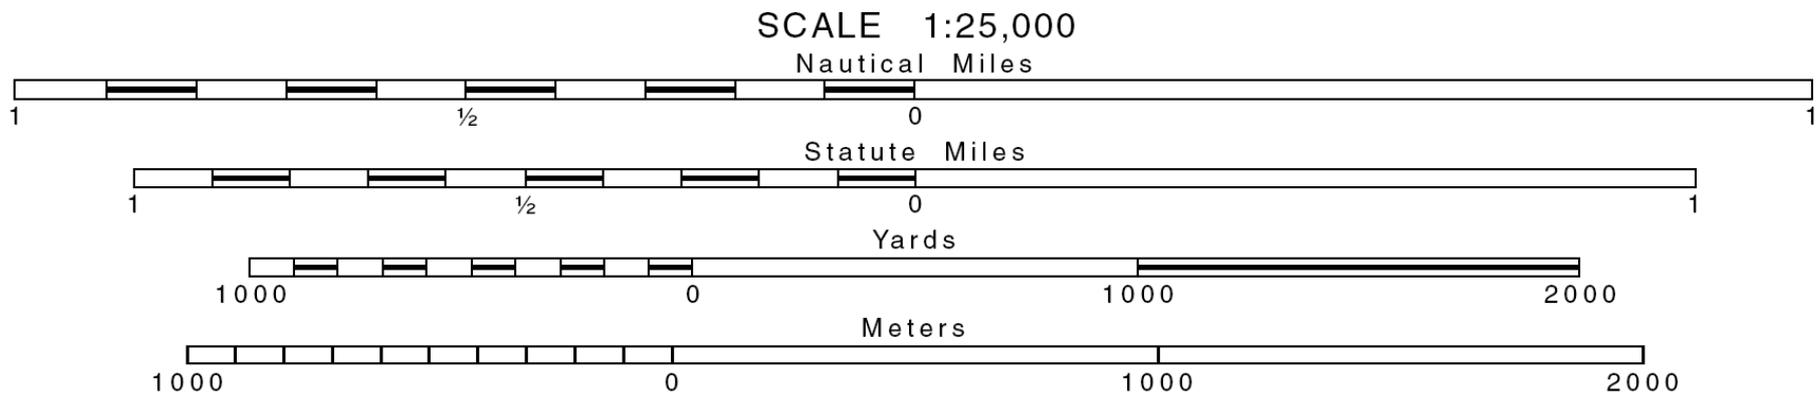

Nautical Mile

1 nautical mile = 1852 meters (exactly)

1 nautical mile \approx one minute of latitude

1 nautical mile \approx 1.15 statute miles

1 nautical mile \approx 6076.1 feet

1 knot = 1 nautical mile per hour

1 knot = 1.852 kph (exactly)

1 knot \approx 1.15 mph

Latitude and Longitude Distances

Latitude:

Parallels are evenly spaced.

1 minute \approx 1 nm.

Longitude:

Meridians converge at poles.

1 minute \approx $\cos(\text{lat}) \times 1$ nm.

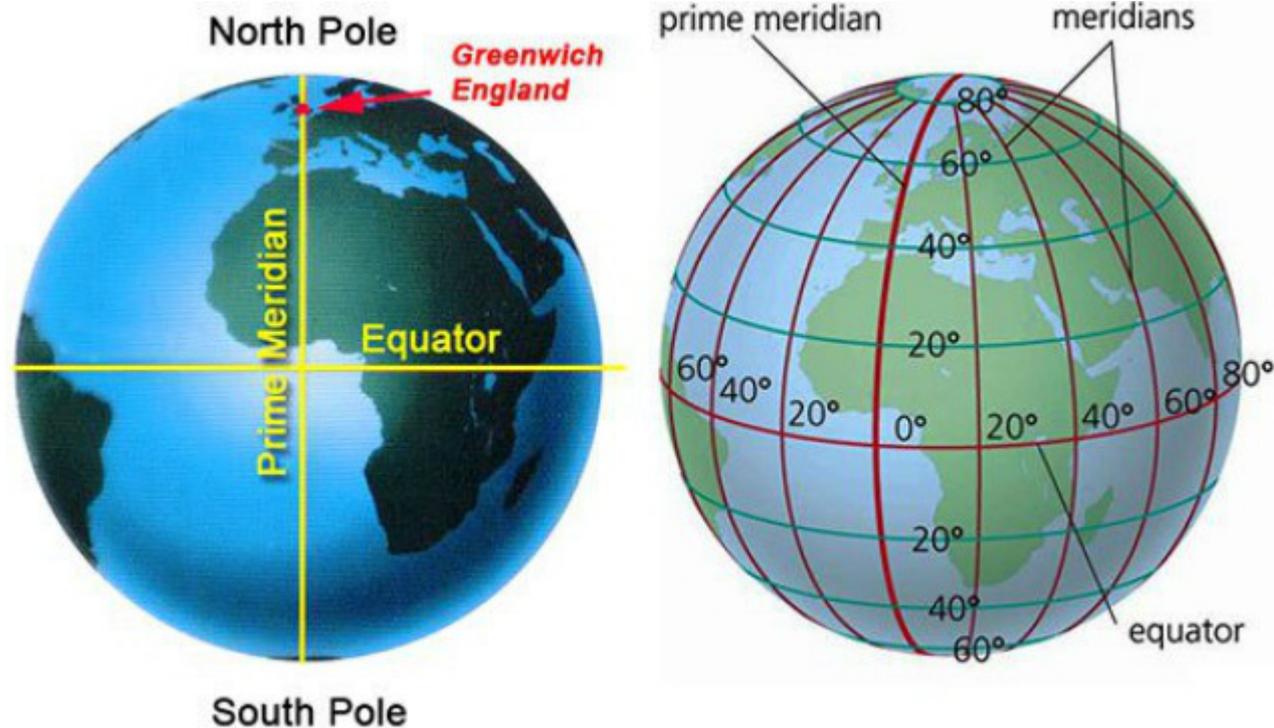

In Boston Harbor:

1 minute longitude \approx .74 nm.

Horizontal Datum

Coordinate system and set of reference points for assigning geographic coordinates (latitude and longitude) to physical locations on the Earth.

Location of Prime Meridian (where longitude = 0)

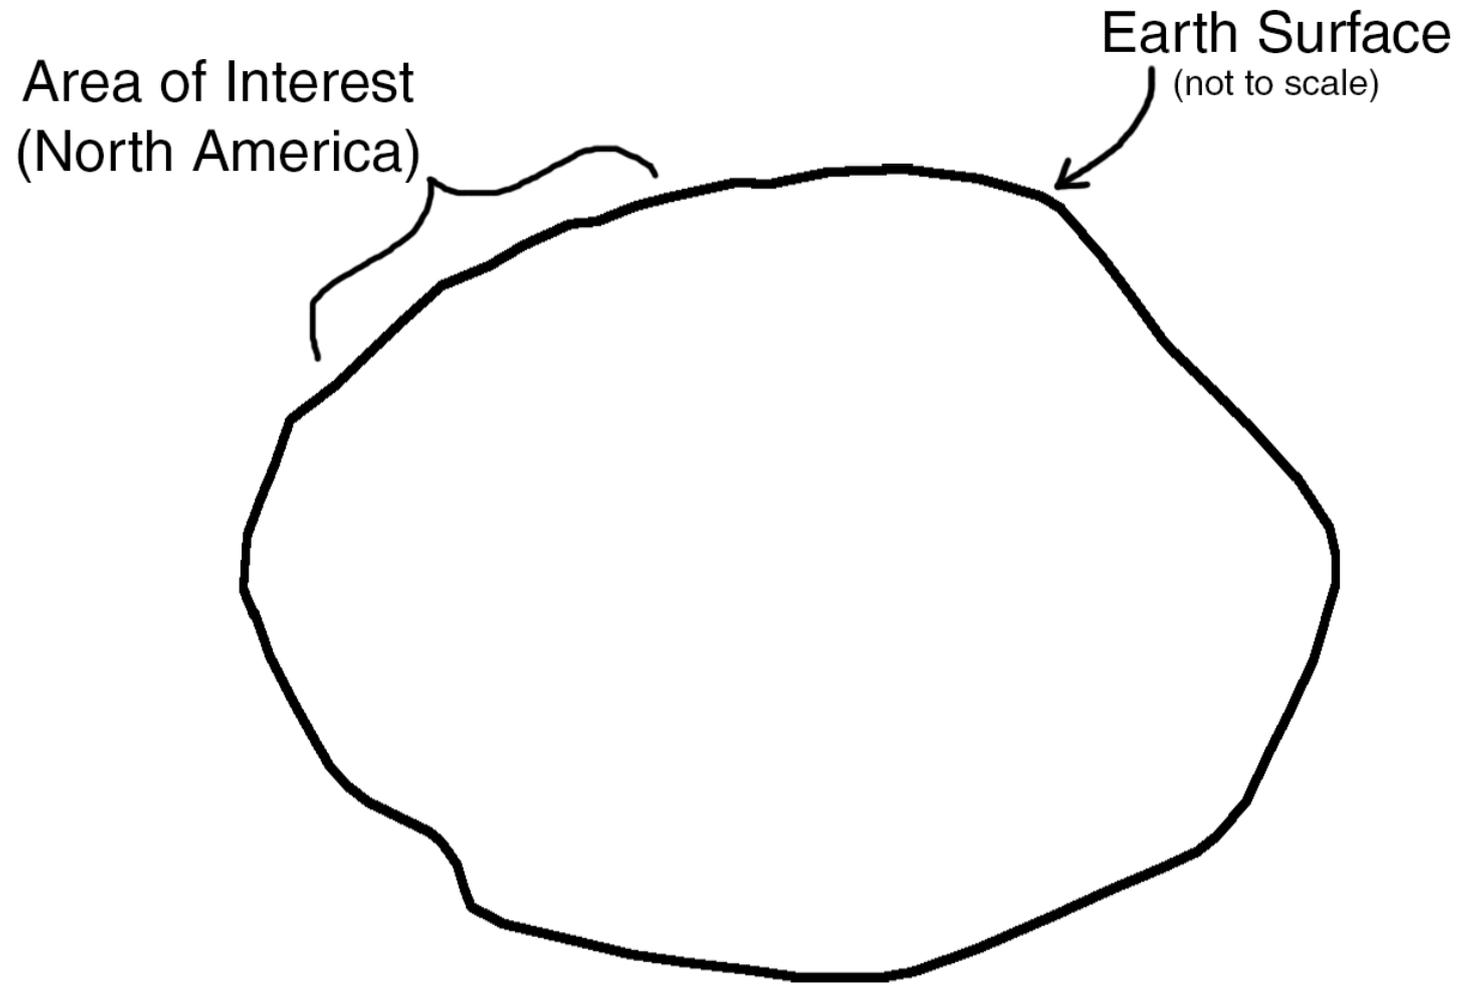

Horizontal Datum

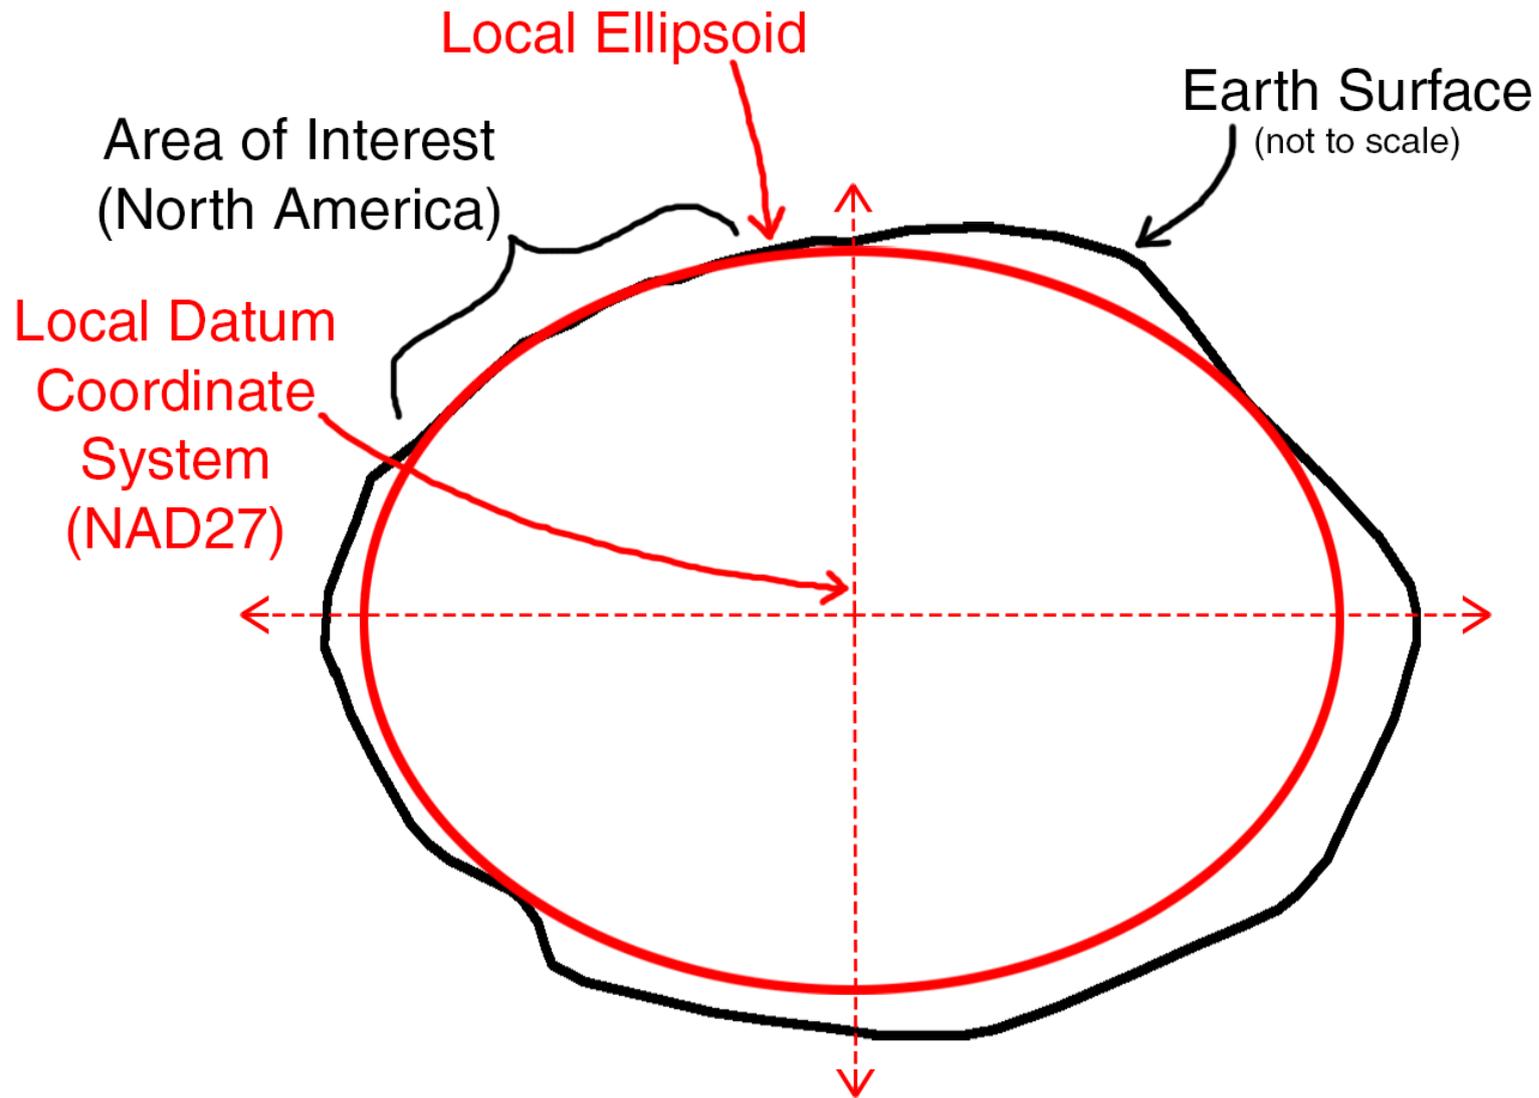

Make sure your GPS and other navigation instruments are using the same Horizontal Datum as your charts.

- World Geodetic System 1984 (WGS84) : global standard
- North American Datum 1983 (NAD83) : official datum used on all U.S. Charts – varies less than 2 m from WGS84.
- North American Datum 1927 (NAD27) : outdated – can vary up to 100 m from WGS84
- Hundreds of other local datums in use around the world.

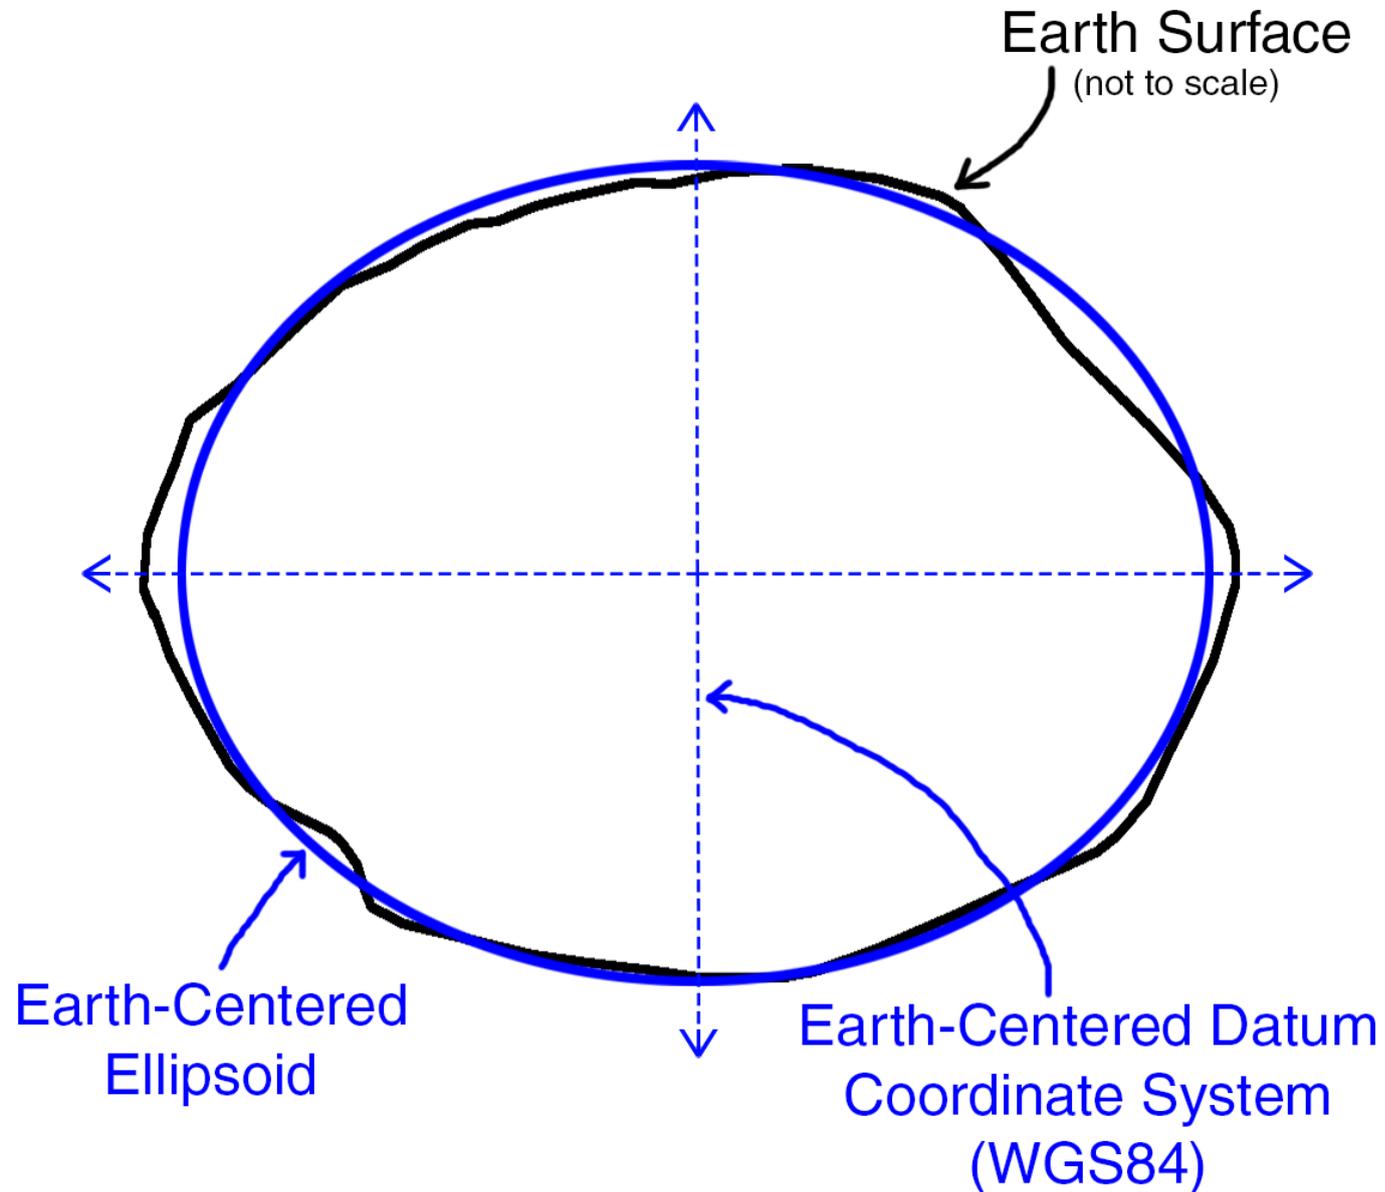

Horizontal Datum

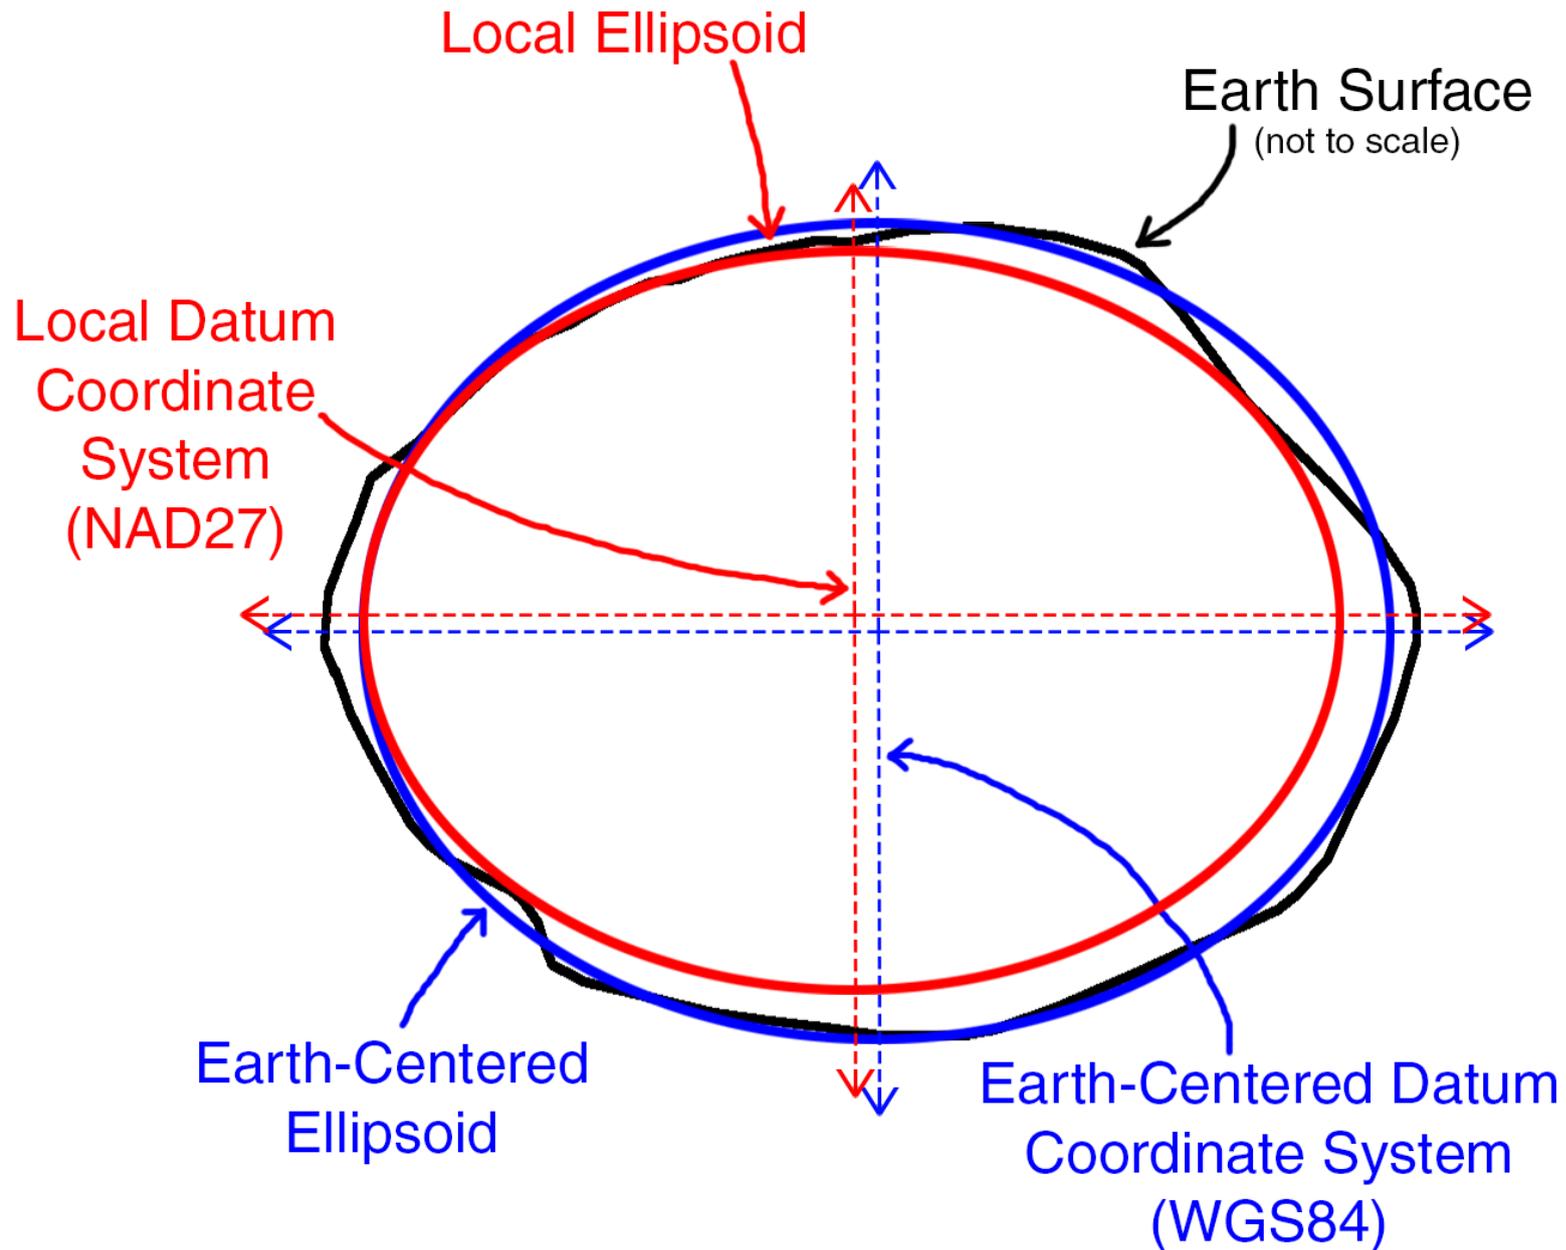

Horizontal Datum

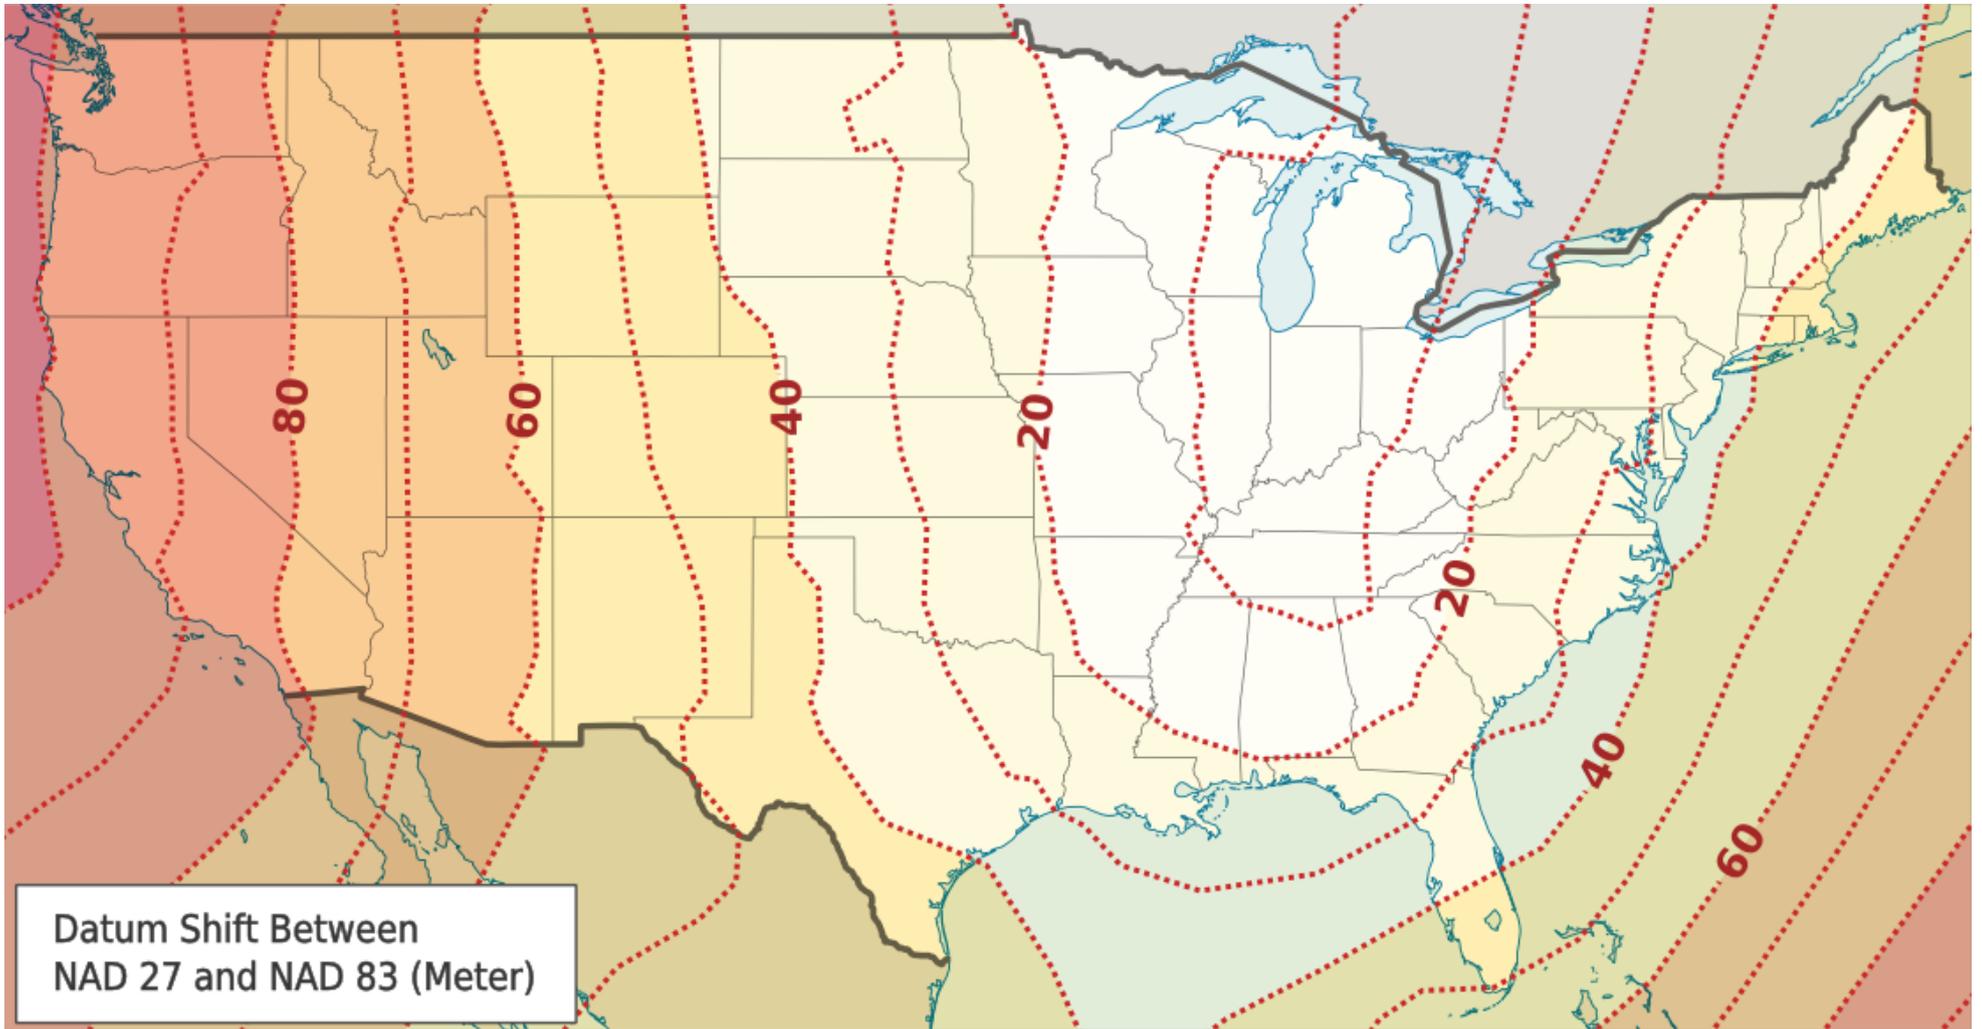

Horizontal Datum

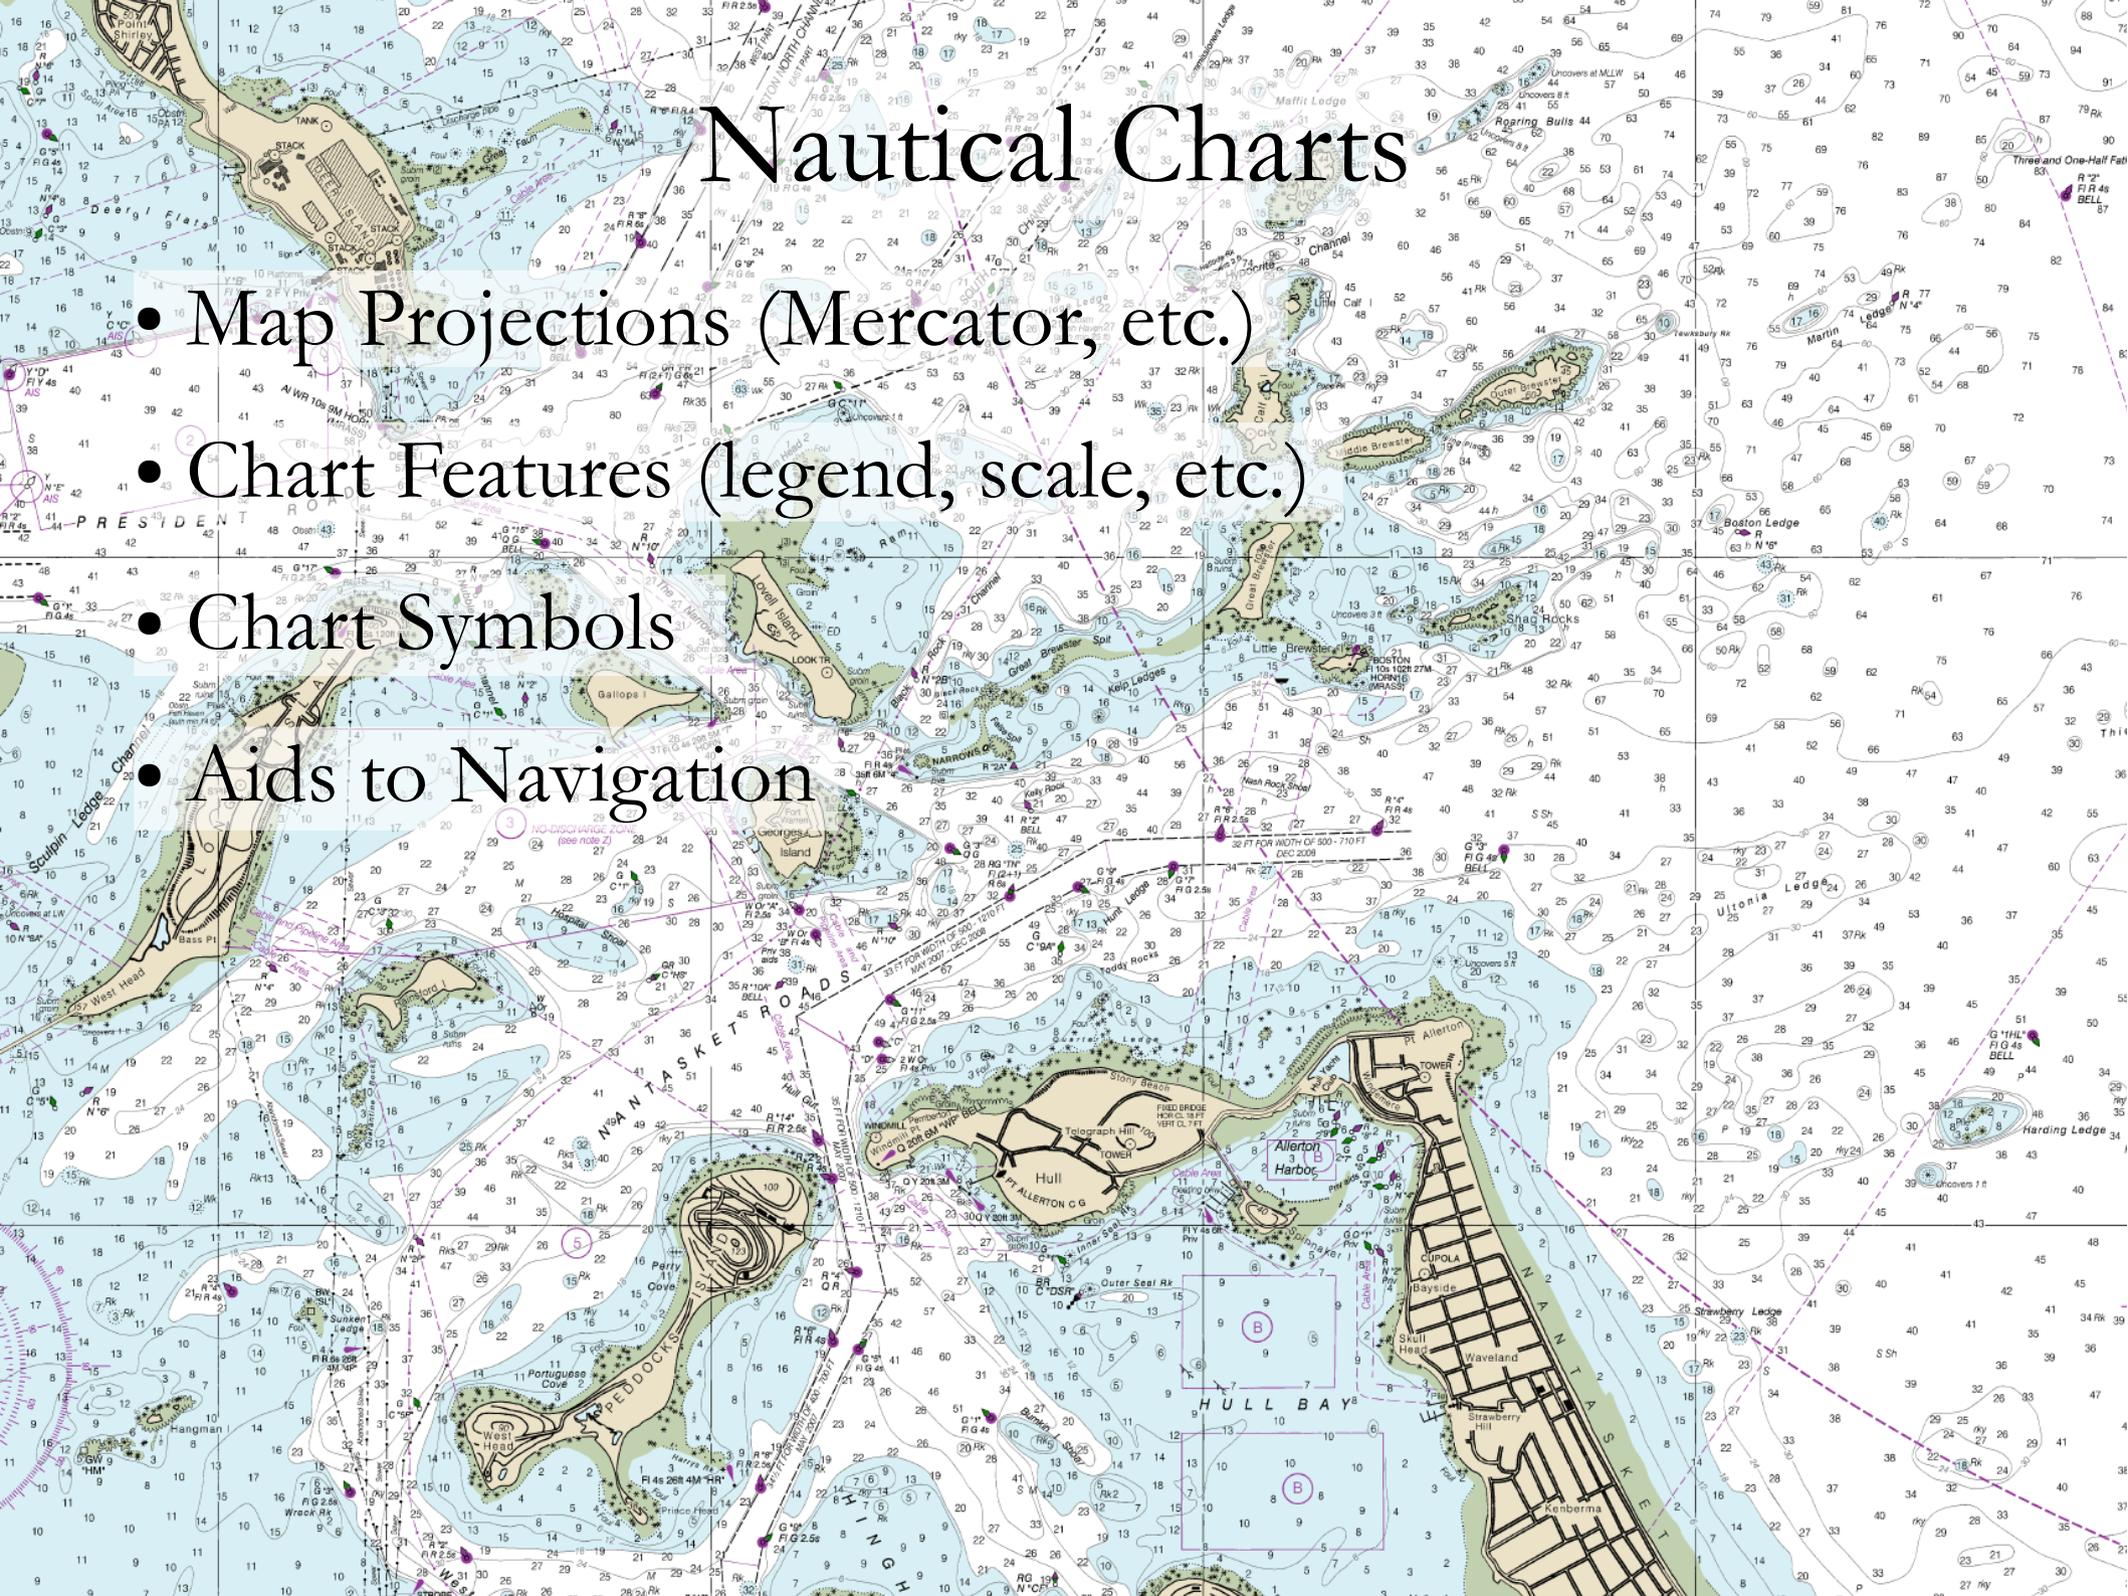

Horizontal Datum

Horizontal Datum

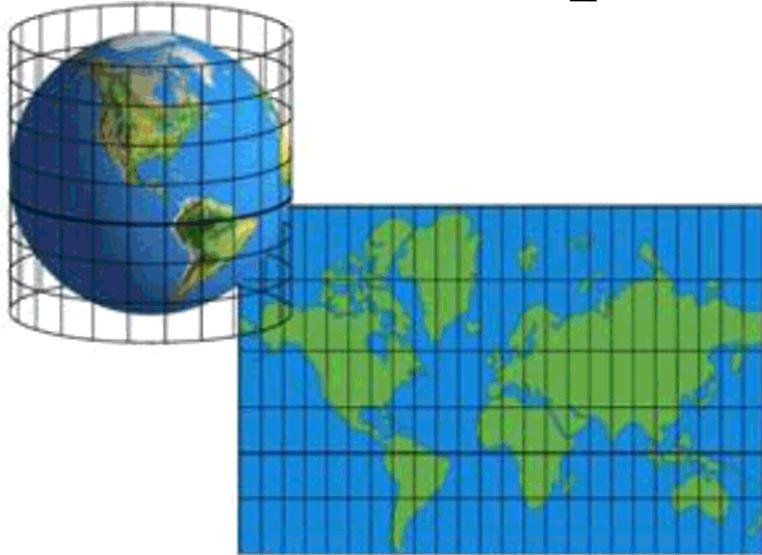

A detailed nautical chart of the Boston Harbor area, showing depth soundings, navigational aids, and geographical features. The chart includes labels for various locations such as Hull, Boston, and various islands and ledges. It features a grid of latitude and longitude lines, depth contours, and various symbols for navigational markers.

Mercator Projection

- Scale changes with latitude
- Meridians and parallels expand at the same rate

Mercator Projection

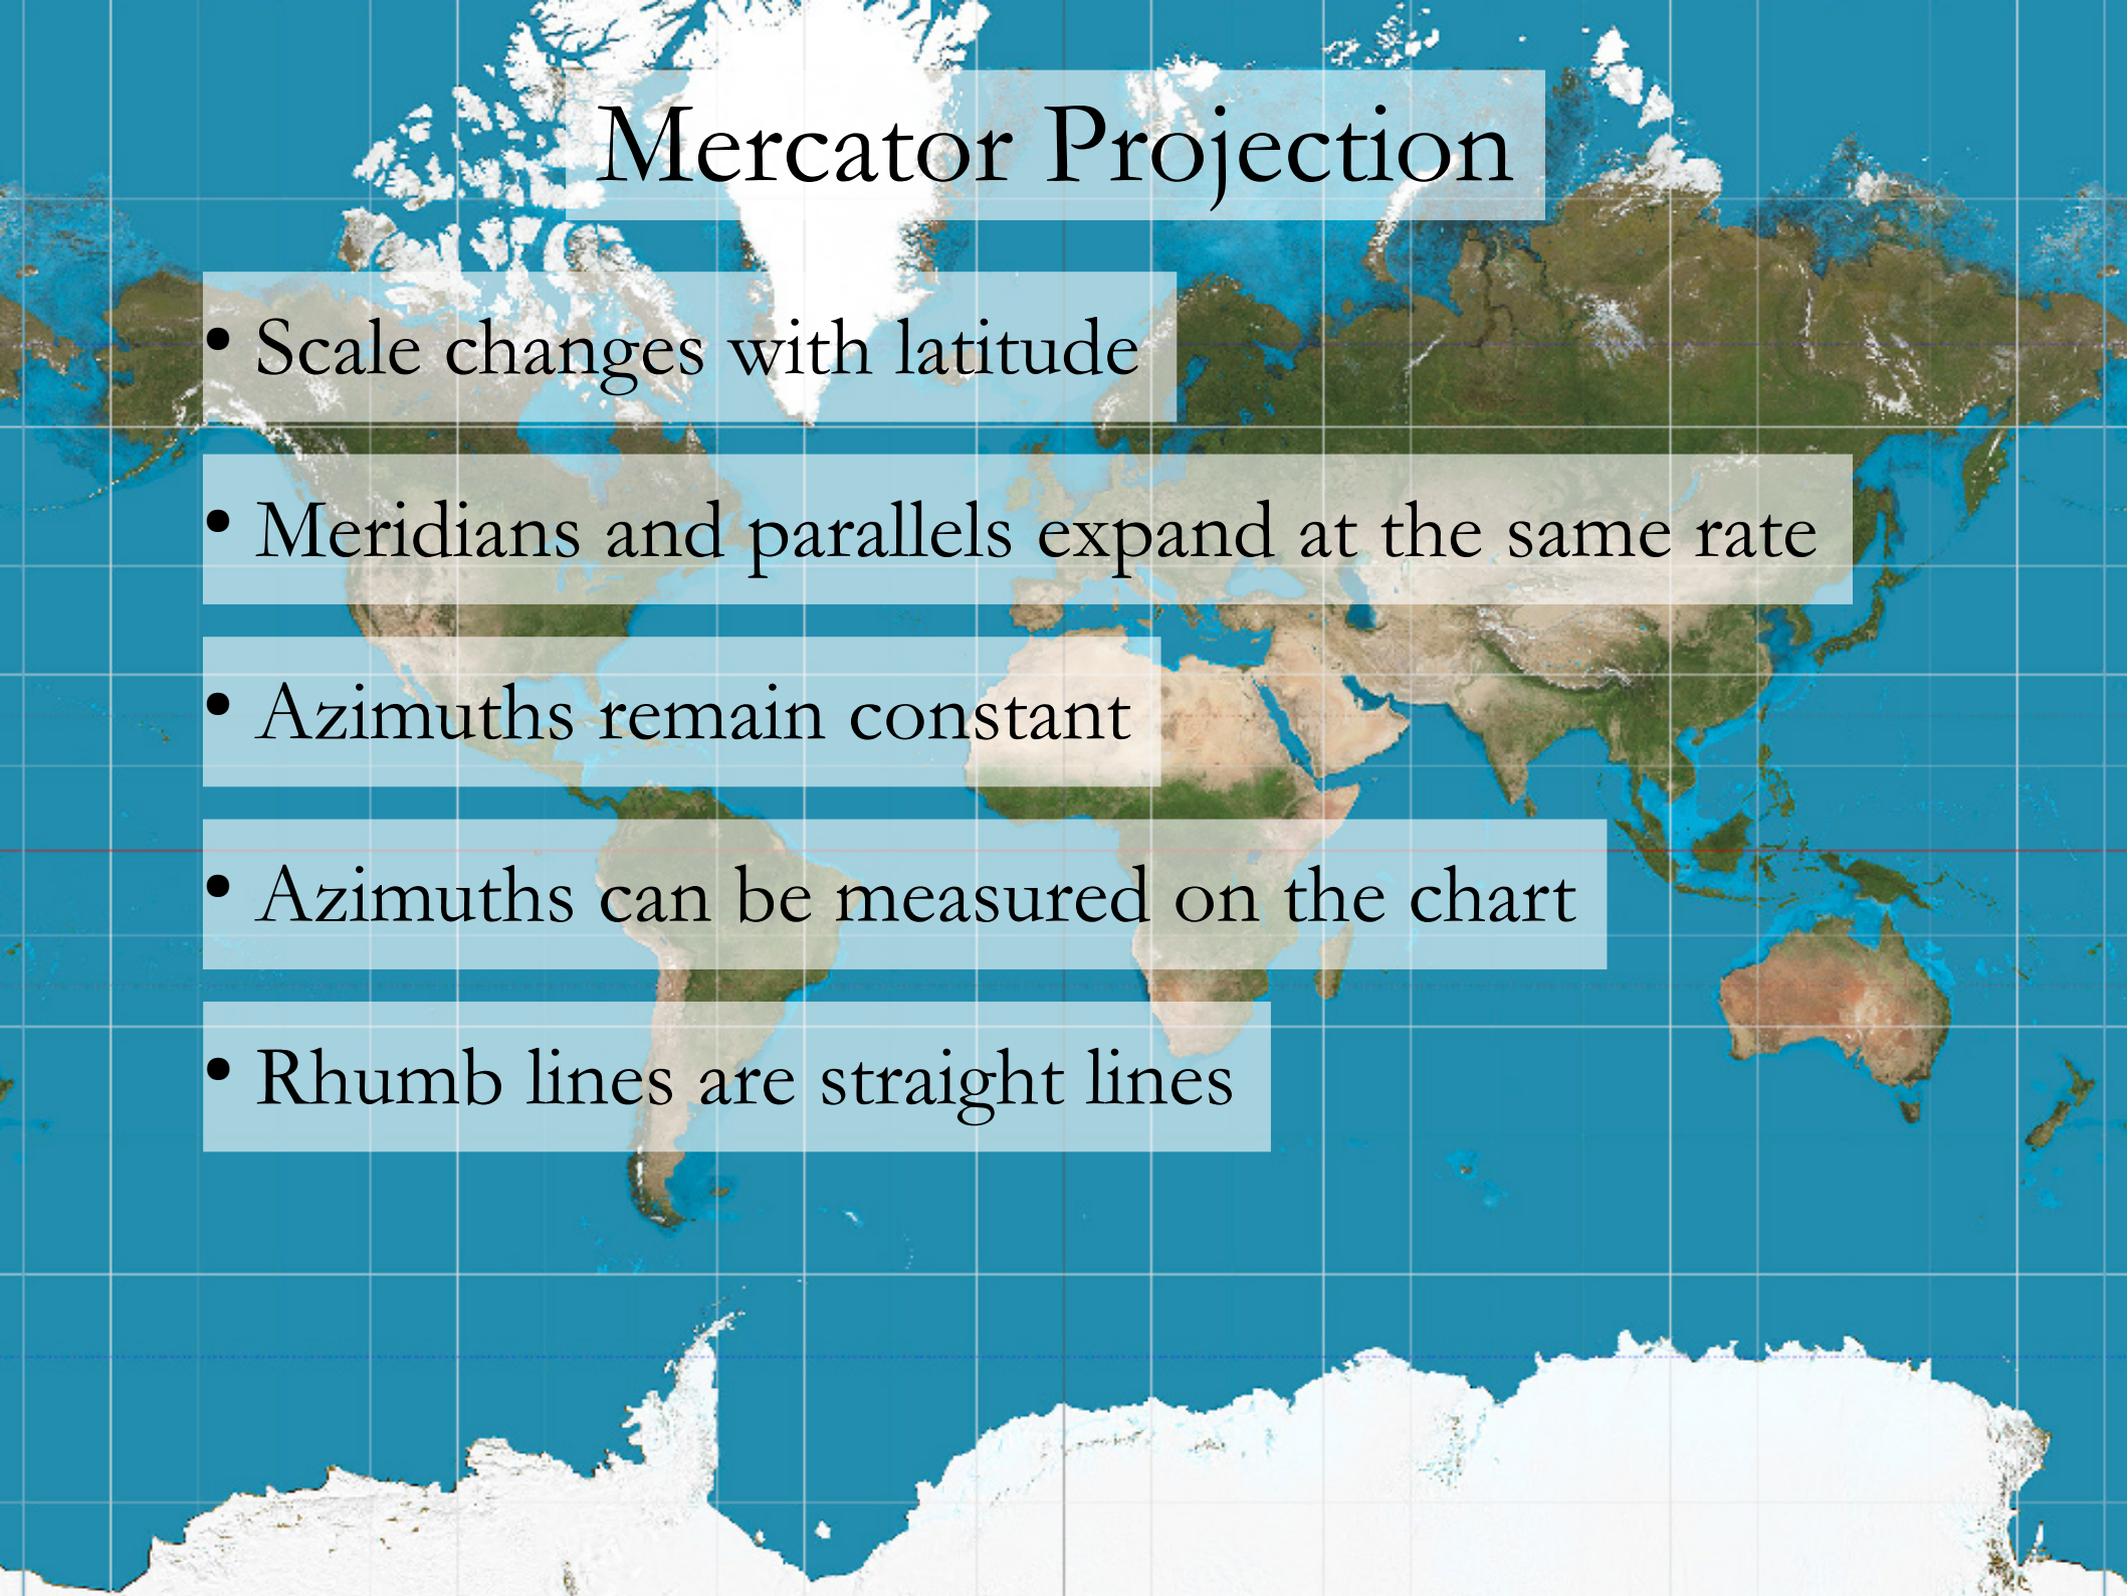

- Scale changes with latitude
- Meridians and parallels expand at the same rate
- Azimuths remain constant

Mercator Projection

- Scale changes with latitude
- Meridians and parallels expand at the same rate
- Azimuths remain constant
- Azimuths can be measured on the chart

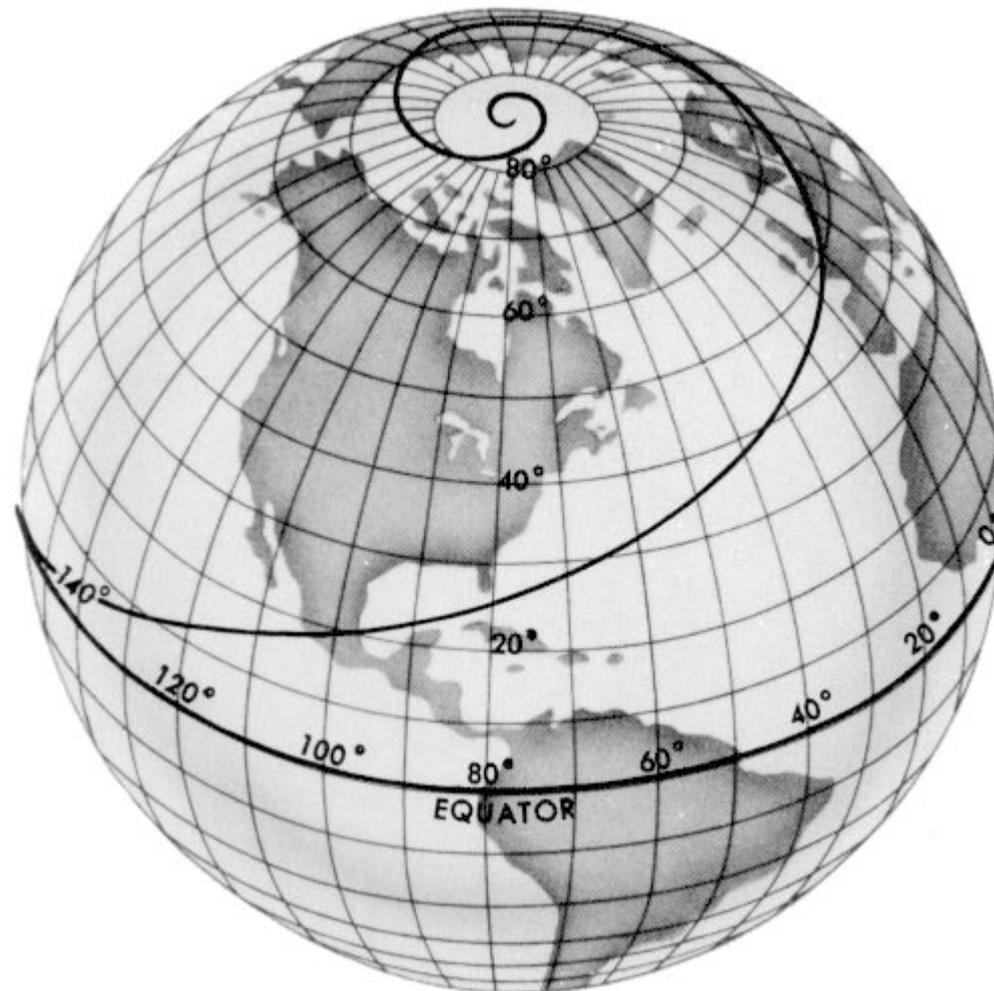

Mercator Projection

- Scale changes with latitude
- Meridians and parallels expand at the same rate
- Azimuths remain constant
- Azimuths can be measured on the chart
- Rhumb lines are straight lines

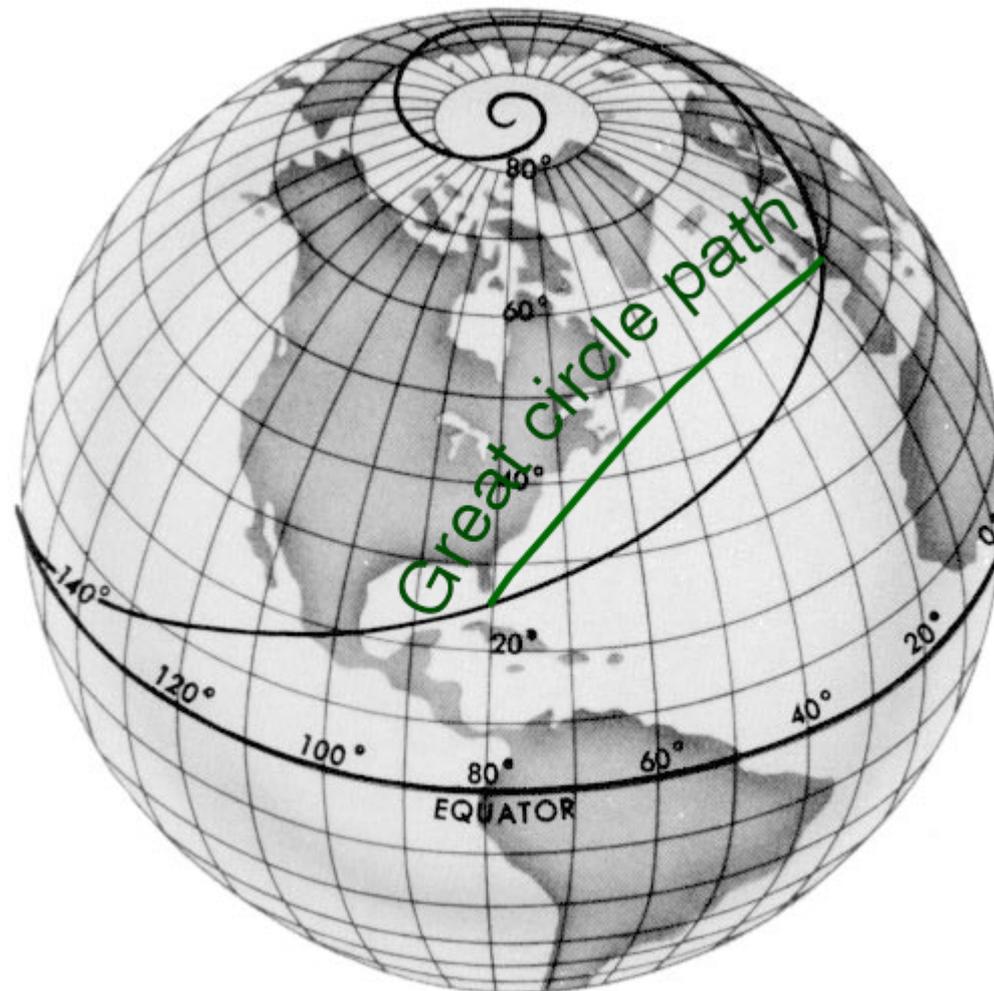

Mercator Projection

- A *rhumb line* is a path of constant azimuth. (also called a *loxodrome*).

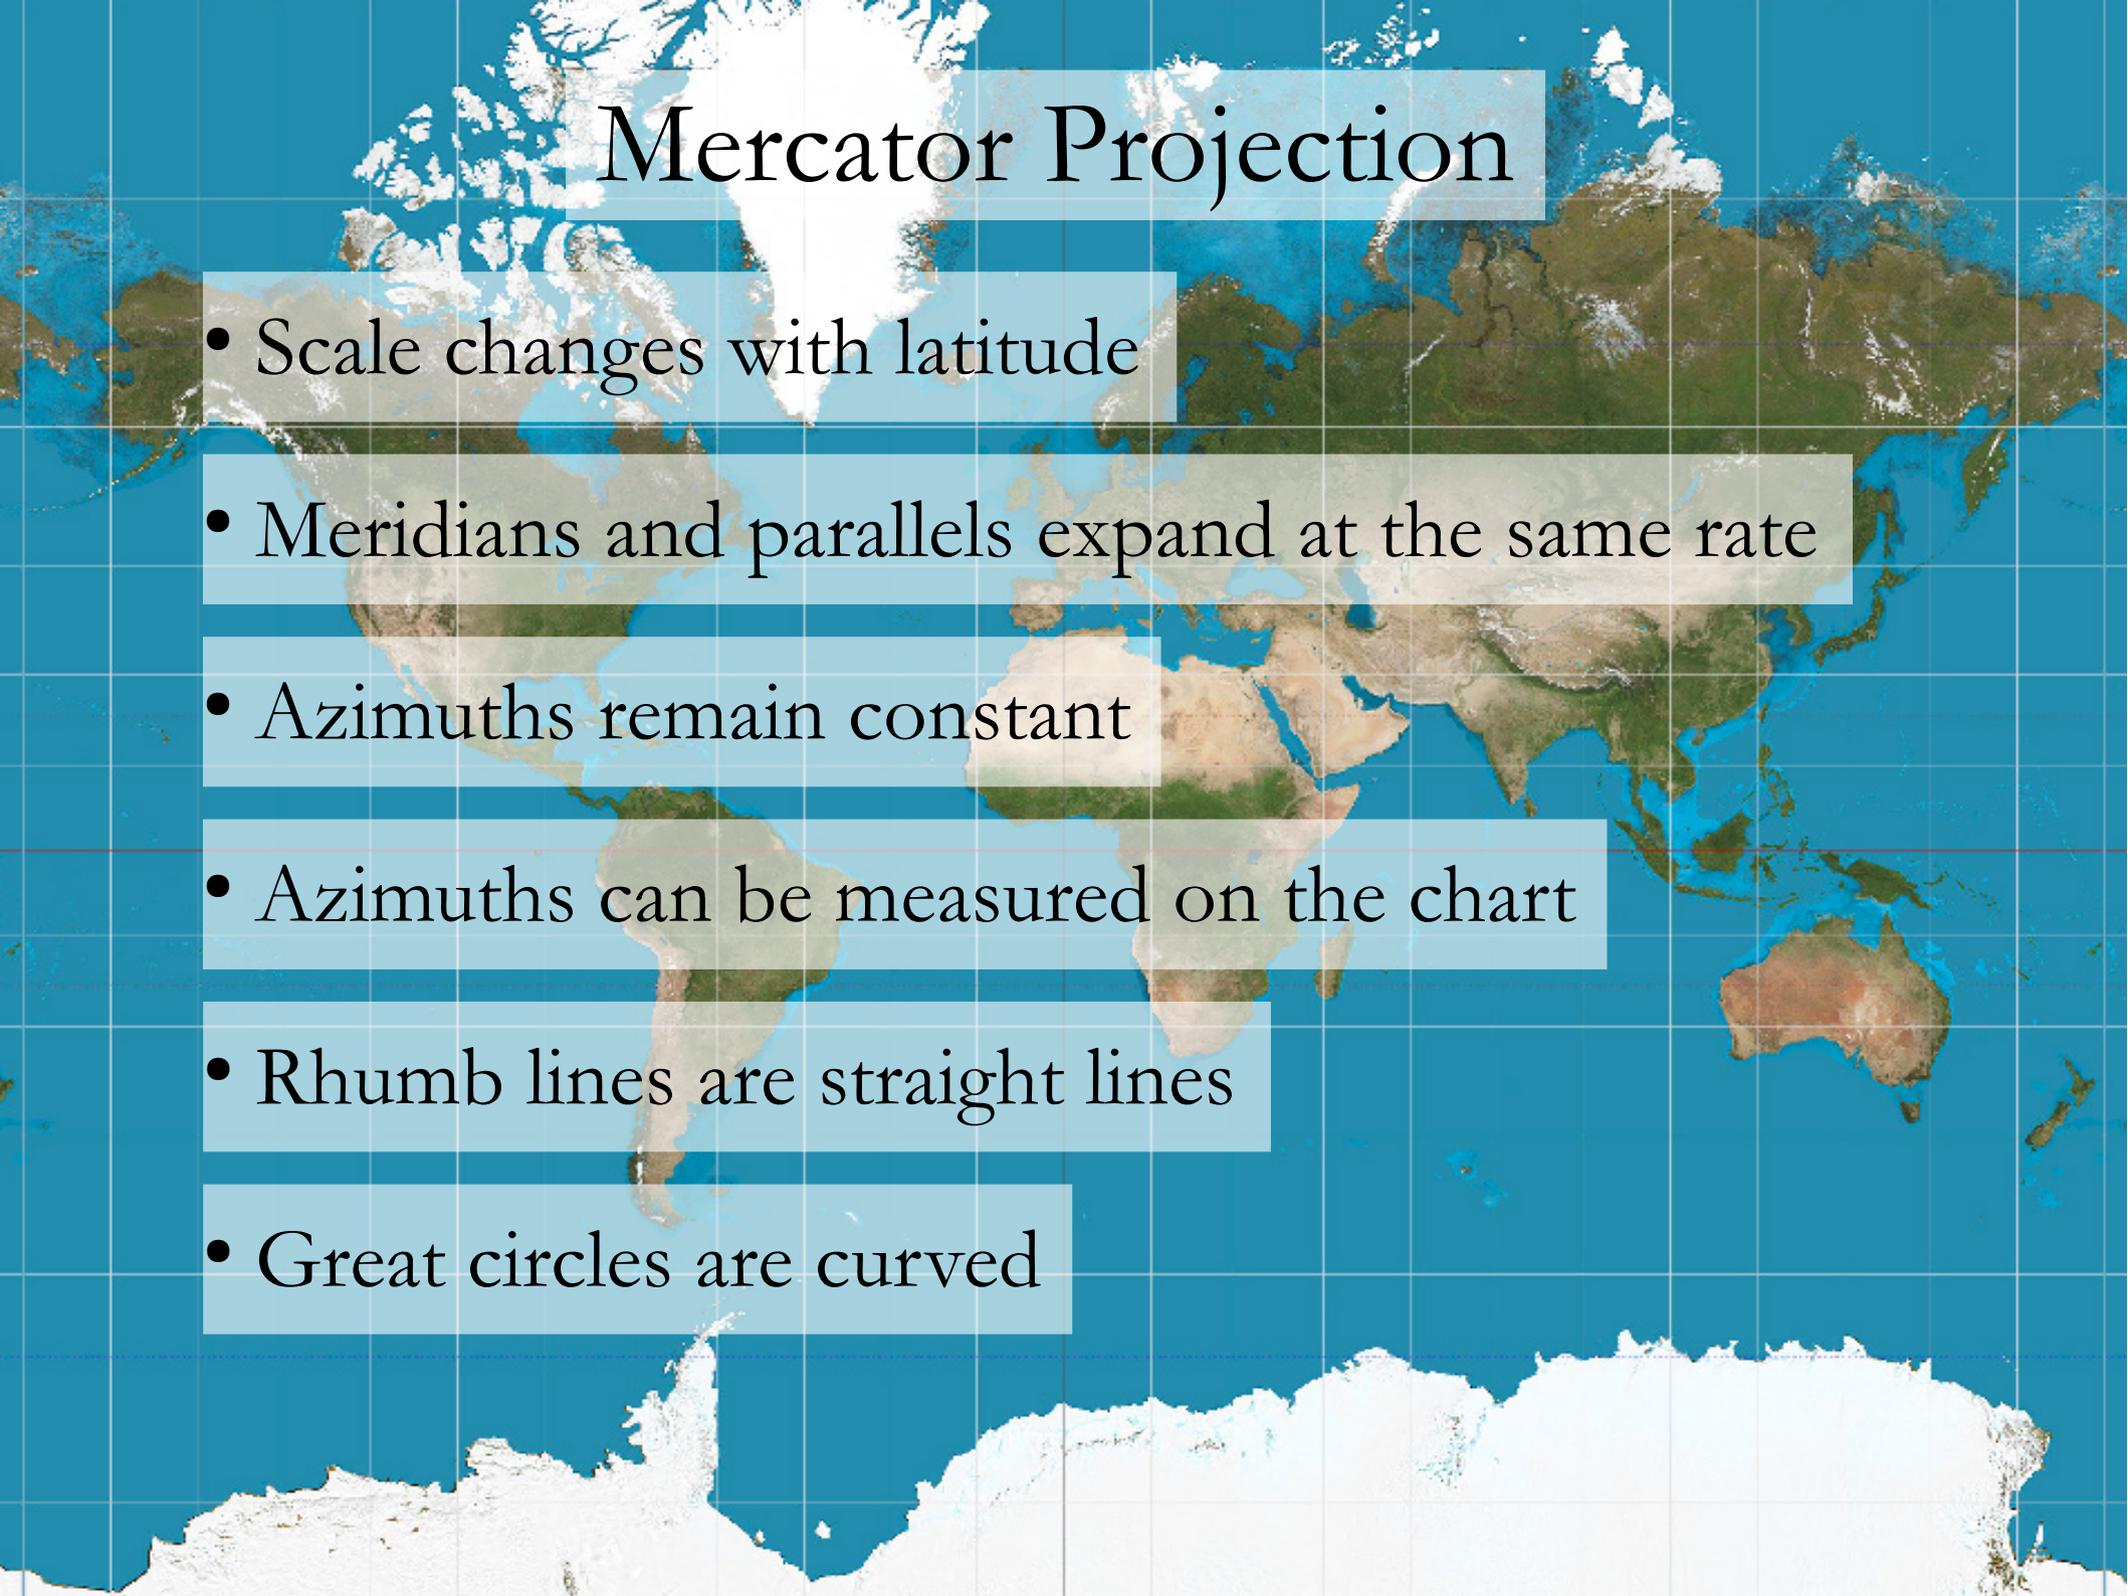

Mercator Projection

- The shortest distance between two points on a sphere is along a great circle.

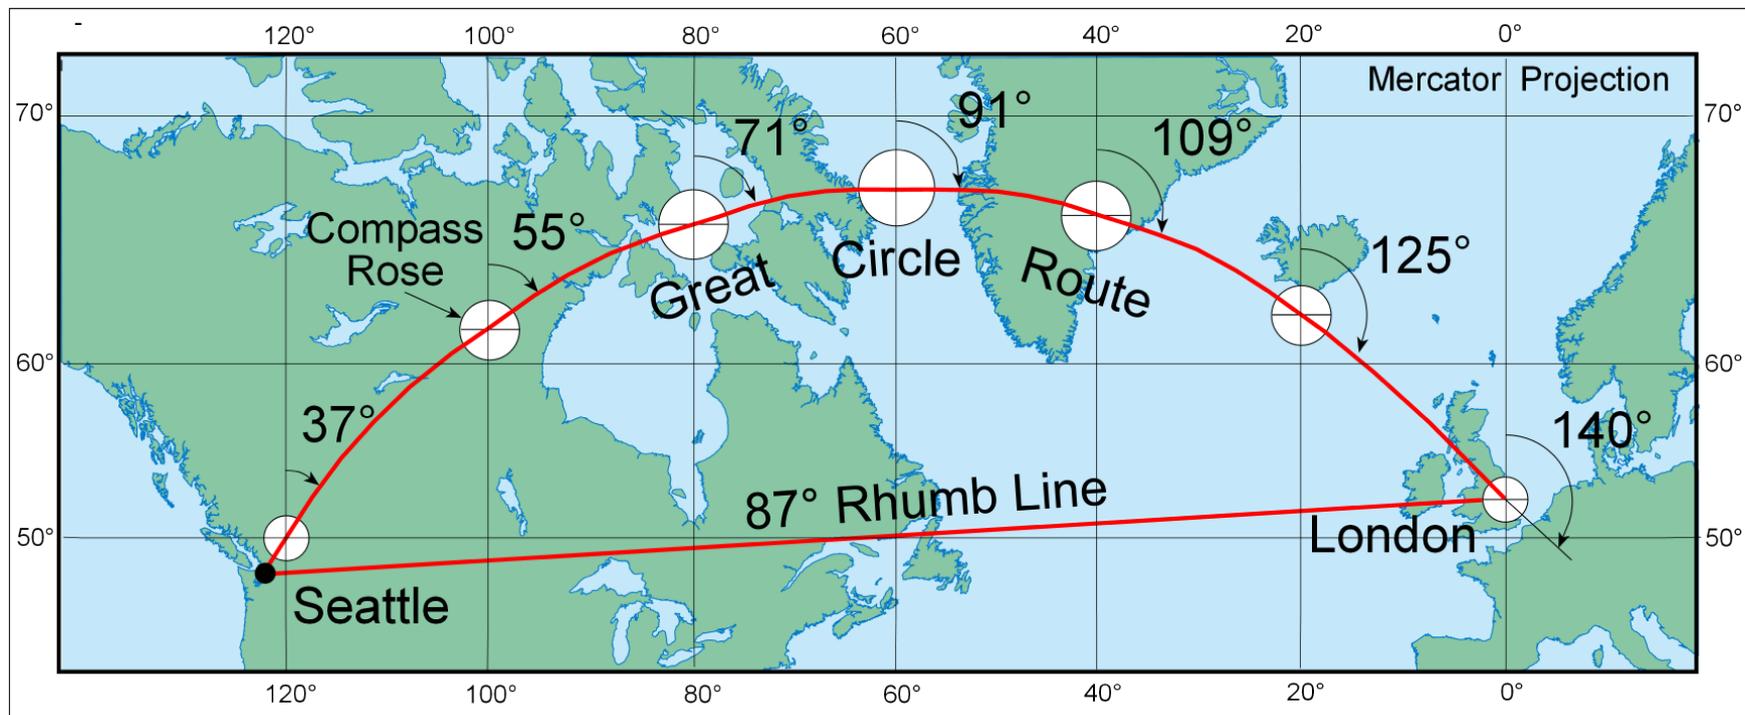

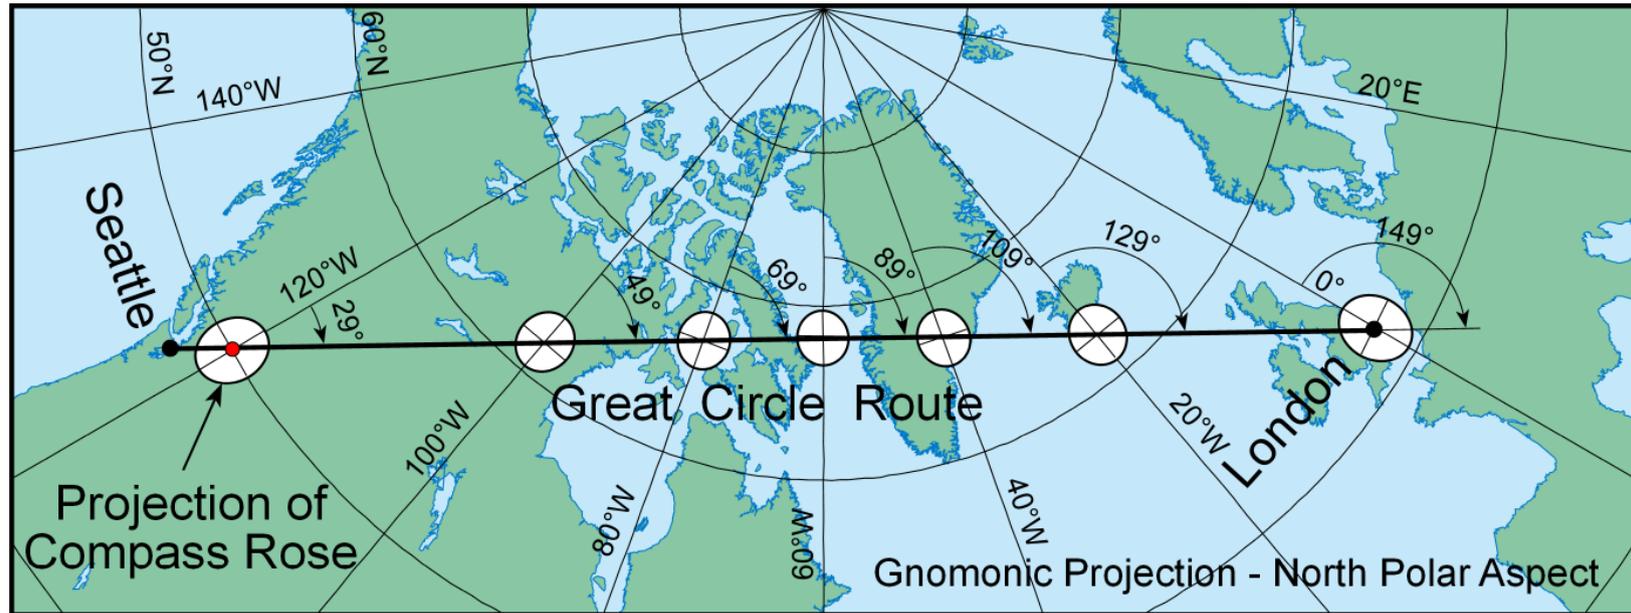

Mercator Projection

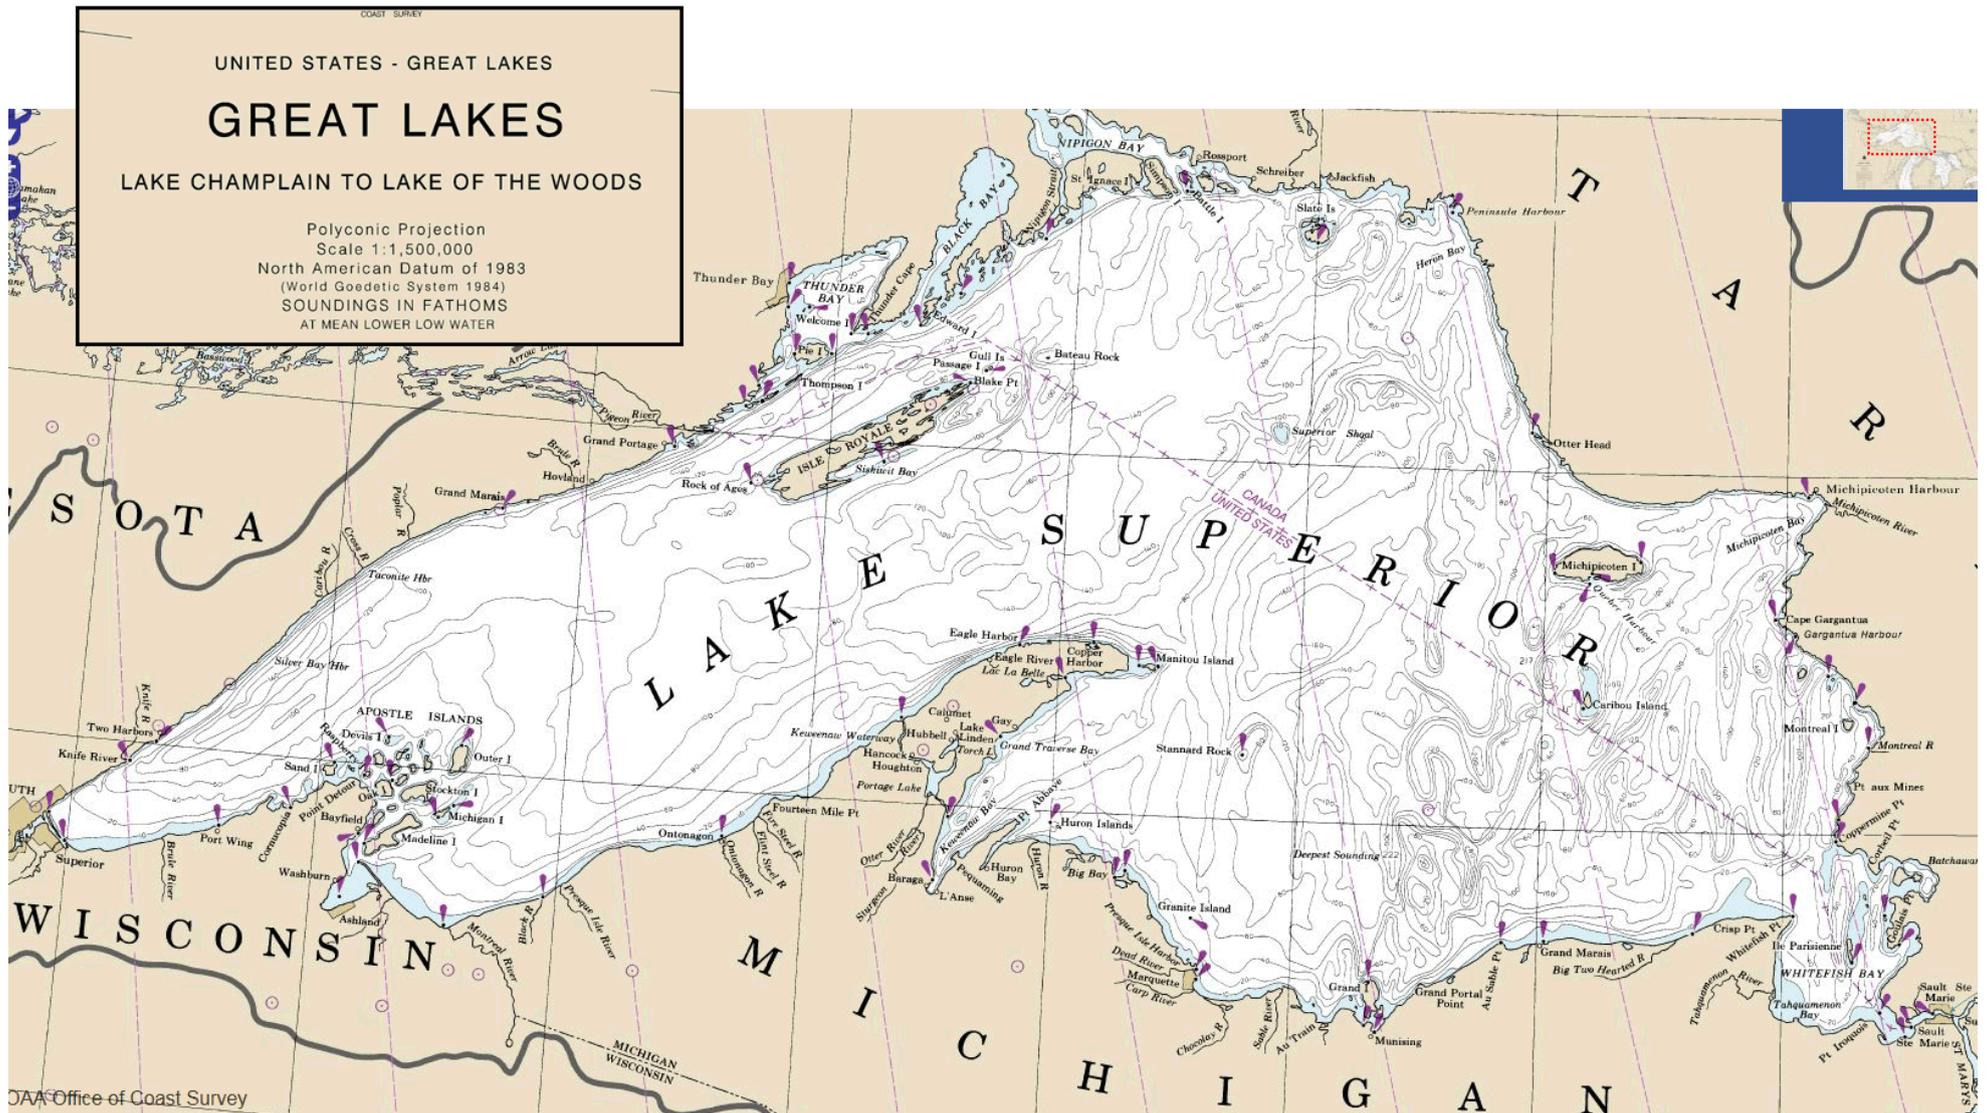

- Scale changes with latitude
- Meridians and parallels expand at the same rate
- Azimuths remain constant
- Azimuths can be measured on the chart
- Rhumb lines are straight lines
- Great circles are curved

Mercator Projection

Polyconic Projection

Used on many charts of the Great Lakes

CAUTION

This chart has been corrected from the Notice to Mariners (NM) published weekly by the National Geospatial-Intelligence Agency and the Local Notice to Mariners (LNM) issued periodically by each U.S. Coast Guard district to the dates shown in the lower left hand corner. Chart updates corrected from Notice to Mariners published after the dates shown in the lower left hand corner are available at nauticalcharts.noaa.gov.

Last Correction: 12/15/2015. Cleared through:
LNM: 5015 (12/15/2015), NM: 5215 (12/26/2015), CHS: 1115 (11/27/2015)

- Chart number: 5 digits
- Above number is edition number and print date
- Corrections to charts are published in Notices to Mariners (NM) and Local Notices to Mariners (LNM)
- New corrections should be applied to chart

All chart symbols are listed in “Chart No. 1”

Rocks, Wrecks, Obstructions, Aquaculture **K**

No.	INT	Description	NOAA	NGA	Other NGA	ECDIS	
General							
1		Danger line: A danger line draws attention to a danger which would not stand out clearly enough if represented solely by its symbol (e.g. isolated rock) or delimits an area containing numerous dangers, through which it is unsafe to navigate					Obstruction, depth not stated Obstruction which covers and uncovers Underwater hazard with depth of 20 meters or less Isolated danger of depth less than the safety contour Foul area, not safe for navigation
2		Swept by wire drag or diver					Swept sounding, less than or equal to safety depth Swept sounding, greater than safety depth
3		Depth unknown, but estimated to have a safe clearance to the depth shown				ECDIS displays safe clearance depths in the same manner as known depths.	
Rocks							
Plane of Reference for Heights → H			Plane of Reference for Depths → H				
10		Rock (islet) which does not cover, height above height datum					Land as a point at small scale Land as an area, with an elevation or control point
11		Rock which covers and uncovers, height above chart datum					Rock which covers and uncovers or is awash at low water Underwater hazard which covers and uncovers with drying height Isolated danger of depth less than the safety contour
12		Rock awash at the level of chart datum					Rock which covers and uncovers or is awash at low water Underwater hazard which covers and uncovers Isolated danger of depth less than the safety contour

Chart Warnings & Local Information

SMALL CRAFT WARNINGS

Year round small-craft warnings will be displayed during daytime only on Metropolitan District Commission Police Patrol Boats underway in Inner Boston Harbor from Nantasket Beach (42° 16.2' N, 70° 51.5' W) to waters around Georges and Lovell Islands.

NOTE B

PRECAUTIONARY AREA

Traffic within the Precautionary Area may consist of vessels operating between Boston Harbor and one of the established traffic lanes. Mariners are advised to exercise extreme care in navigating within this area.

Recommended traffic lanes have been established for the approach to Boston Harbor. Use charts 13200 and 13267.

Aids to Navigation (ATONs)

ATONs

- Buoys – floating, anchored to bottom
- Beacons – fixed to land, lit or unlit
 - Lights – fixed to land and lit
 - Daybeacons – fixed to land and unlit

ATON Identification

Features of ATONs:

- Floating (buoys) or fixed to land (beacons)
- Color (red, green, yellow, etc.)
- Shape (cylinder, cone, tower, ball, etc.)
- Topmark (ball, cone)
- Light color and pattern
- Numbers or letters
- Sound (bell, gong, whistle, fog horn)
- Radar transponder (RACON)

ATON Usage

- Lateral marks – mark sides of a channel (red, green)
- Center channel markers (red/white striped)
- Danger marks (red/black or other)
- Cardinal indicators (indicate safe water in one direction)
- Warnings/restrictions (white/orange)
- Other special purposes (yellow)

Light Characteristics

Description	Characteristic	Chart Abbreviation
Alternating		Alt. R.W.G.
Fixed		F.
Flashing		Fl.
Group flashing		Gp Fl.(2)
Occulting		Occ.
Group occulting		Gp Occ(3)
Quick flashing		Qk.Fl.
Very quick flashing		V.Qk.Fl.
Isophase		Iso.
Morse		Mo.(letter)

Lateral Marks

“Red Right Returning”

Usually mark a channel. Can be buoys, lights or daybeacons. Keep red lateral marks to starboard (to the right) when “returning” to a smaller harbor from a larger body of water.

Green:

- Odd Numbers
- Square or Cylinder

Red:

- Even Numbers
- Triangle or Cone

Cans & Nuns

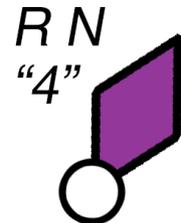

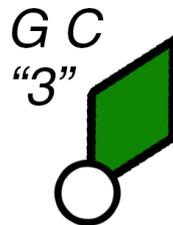

- Are never lighted.
- Never have sounds
- When used as lateral marks:

Cans:

- Green
- Odd number

Nuns:

- Red
- Even number

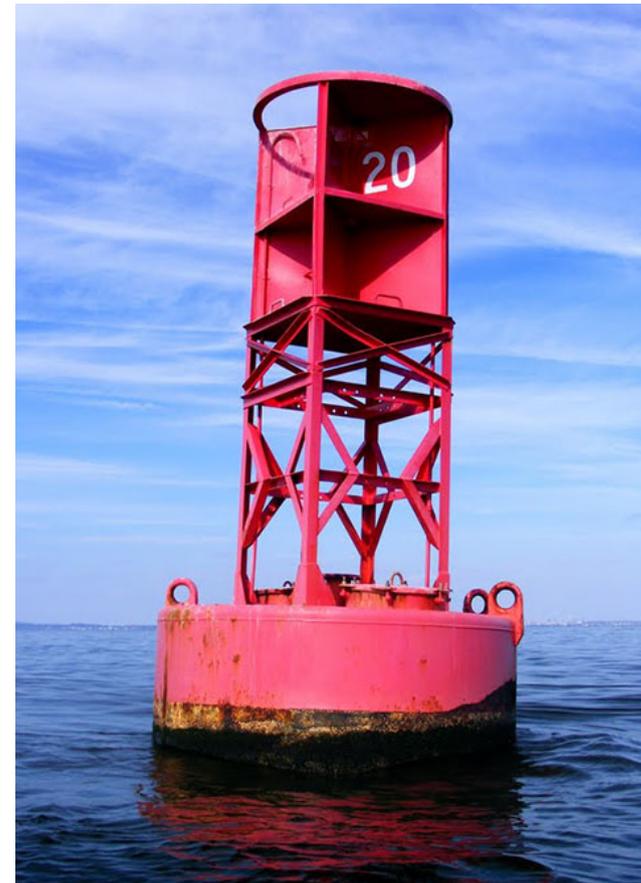

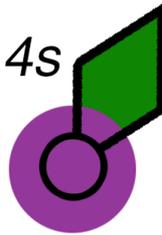

Tower Buoys

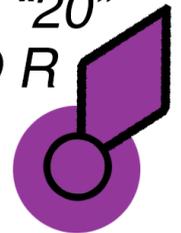

- May be lighted or have sounds.
- Light color usually matches buoy color

G "1"
Fl G 4s

R "20"
Q R

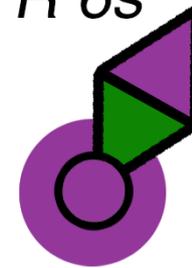

Preferred Channel Buoys

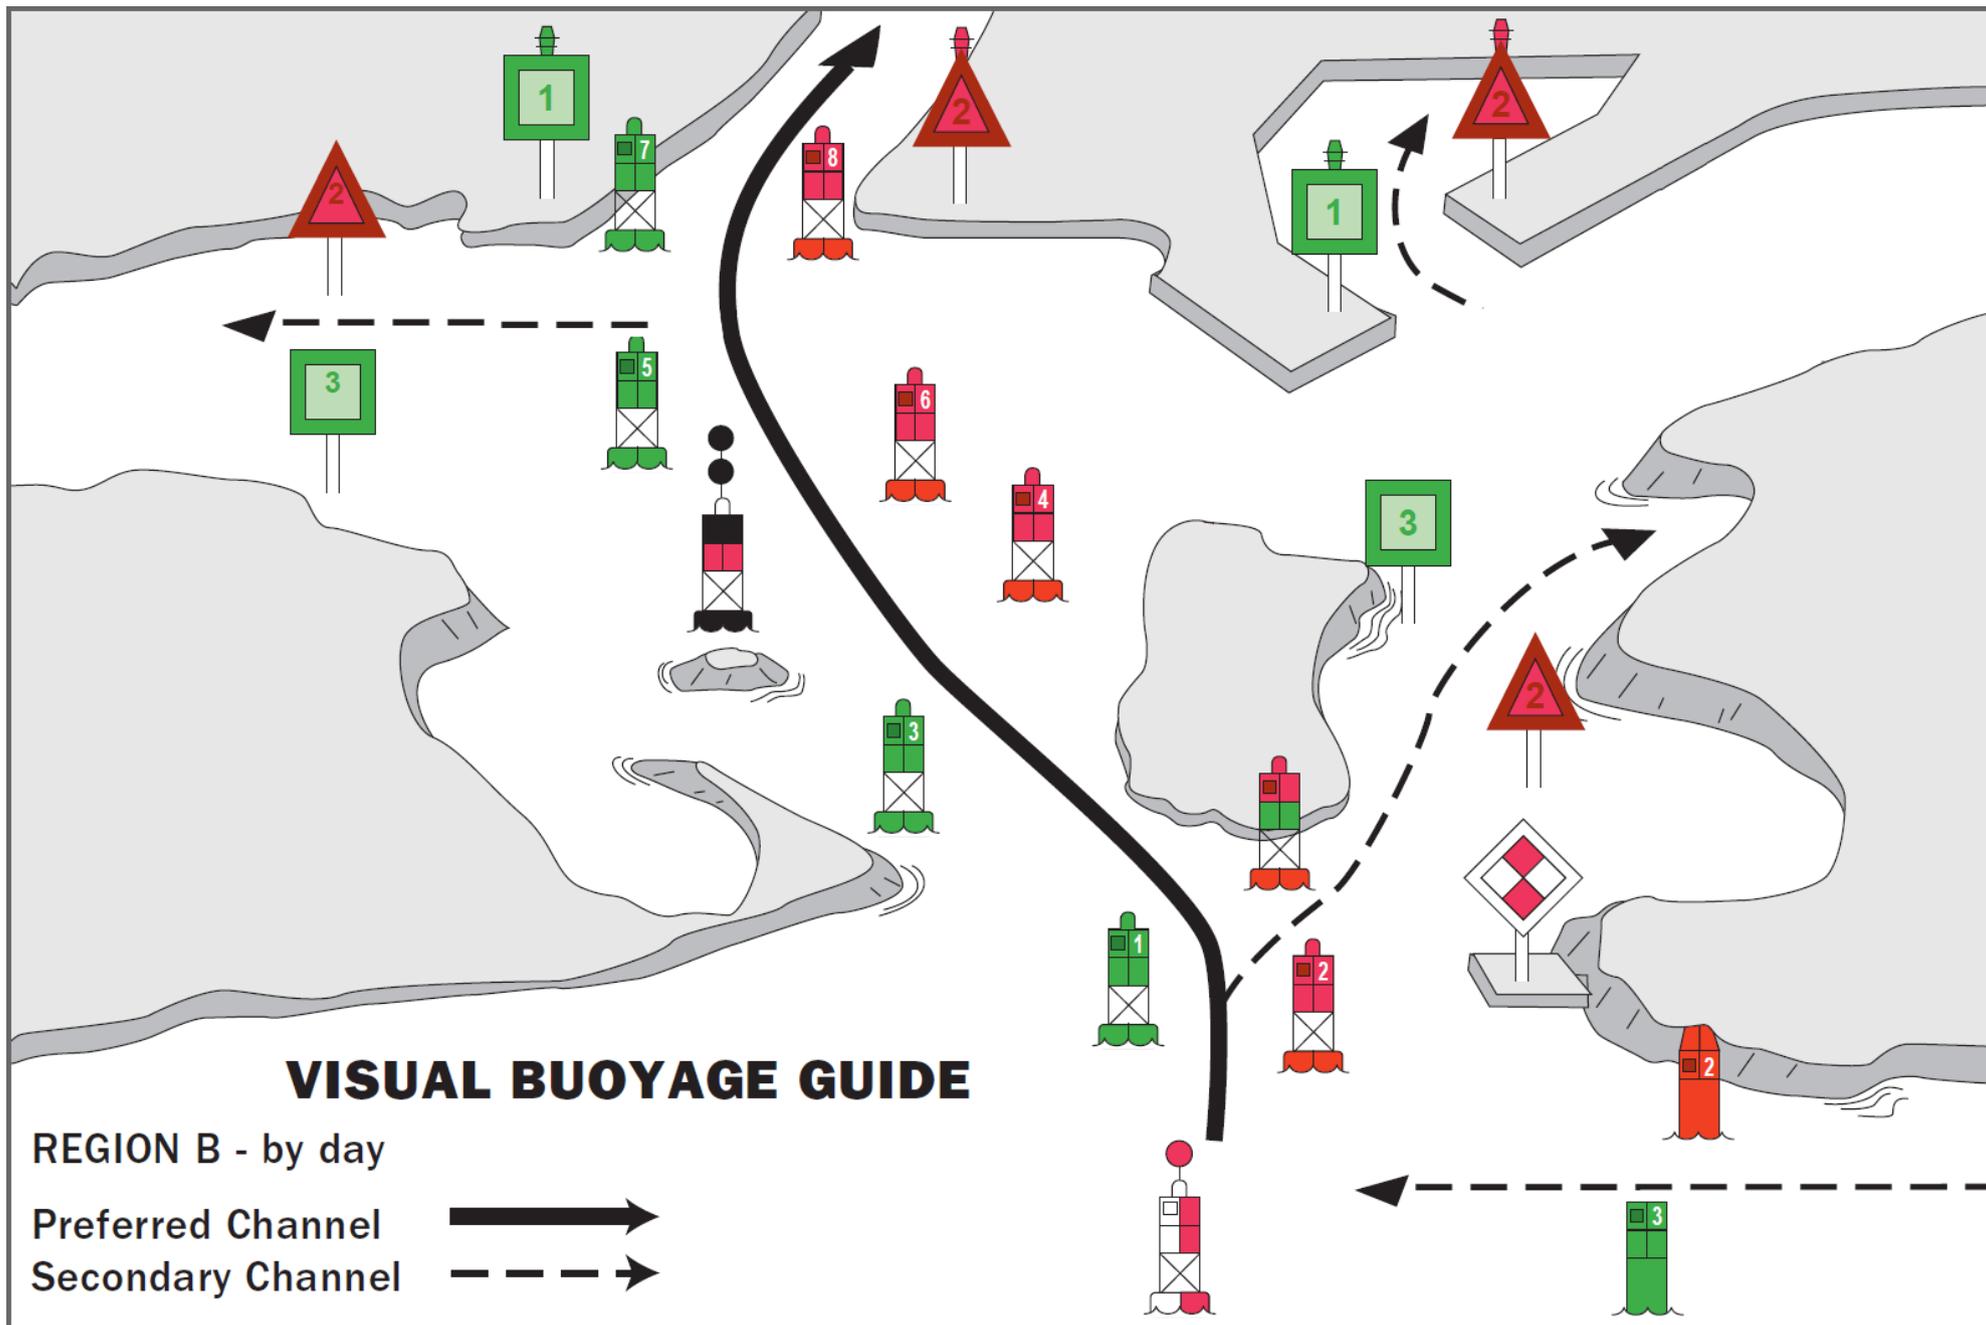

- Red/Green/Red or Green/Red/Green
- Placed at channel intersections
- Top color indicates preferred channel
- No numbers, may be lettered

RG "PR"
Fl (2+1) R 6s

Lateral System

Center Channel Buoys

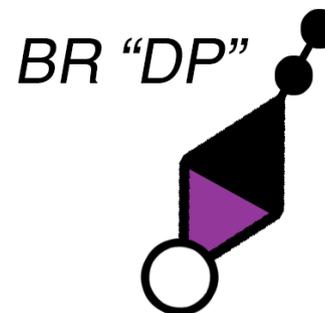

- Red & white vertical stripes
- Ball topmark
- If lit, white morse-A light pattern (•—)
- Sometimes have whistles
- Sometimes have radar transponders

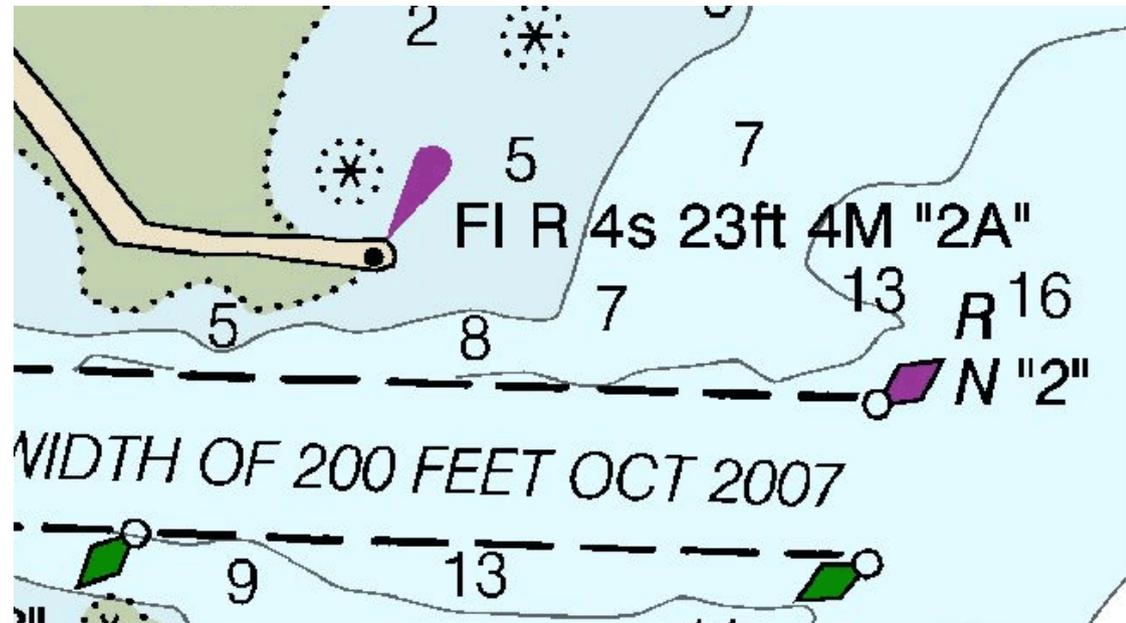

RW "M"
Mo (A)
WHIS
RACON (--)

Danger Buoys

- Red & black
- Two black ball topmarks
- No numbers, may be lettered
- If lit, white (2) group flashing pattern

Lights

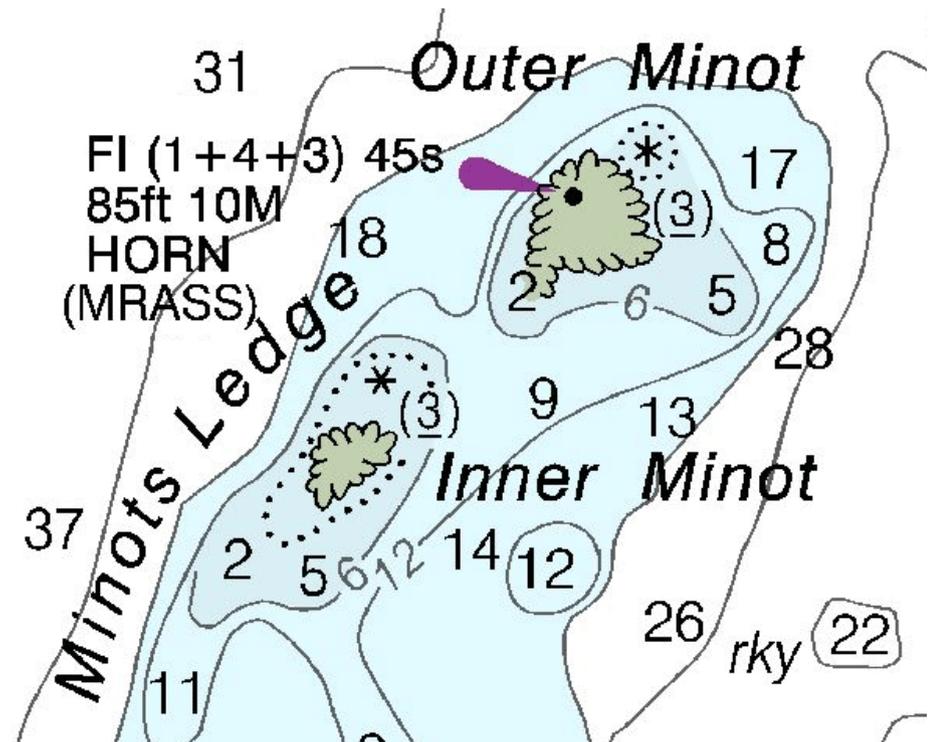

Scituate North Jetty Light 2A

Flashing Red 4s

23 feet above high water

4 miles nominal visibility

Lights

Minot Light

Group flashing (1+4+3) 45 sec.

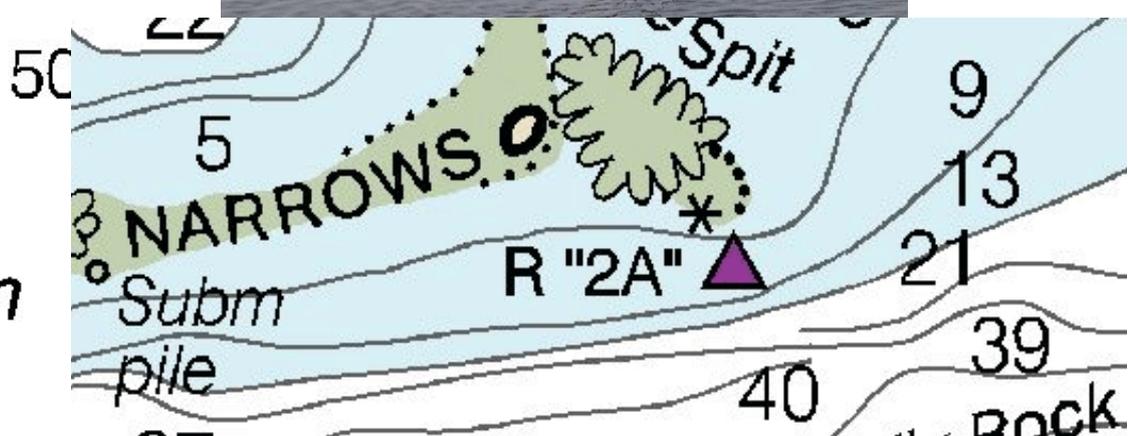

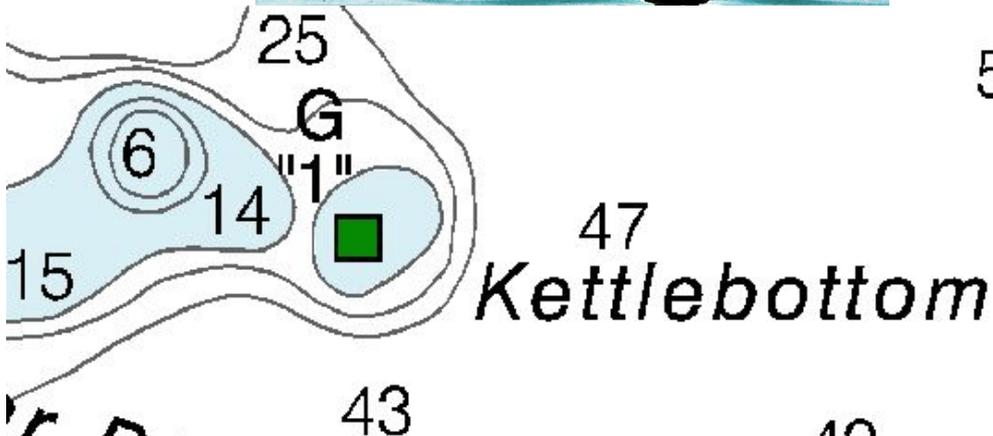

85 feet above high water

10 miles nominal visibility

Fog Horn (MRASS)

Daybeacons

- No lights and fixed to land.

Light List

Full details on all official ATONs can be found in the “Light List” including:

- Official number
- Official name
- Latitude & longitude
- Light pattern details (if lit)
- Height (if on land)
- Nominal Range (if lit)
- Physical description (e.g. “White Conical Tower with Red Stripe”, or “Steel Tripod with Mast”)
- Additional Comments

<https://navcen.uscg.gov/?pageName=lightlists>

The Magnetic Compass

The Ship's Compass

The compass is usually mounted on a pedestal called a “binnacle”. It is directly in front of the helm, so the helmsman can steer by it.

The compass contains a magnetized “card” floating in oil, weighted so it stays level, even if the ship is heeling. The heading is indicated by the numbers, written on the card, when they line up with the fixed “lubber's line”.

The Earth's Magnetic Field

The Earth's magnetic field is a three-dimensional vector field that changes in magnitude and direction over the surface of the Earth.

The magnetic field also varies slowly over time.

The magnetic poles (created by the Earth's magnetic field) do not line up with the geographic poles (defined by the rotation of the planet).

The Earth's Magnetic Field

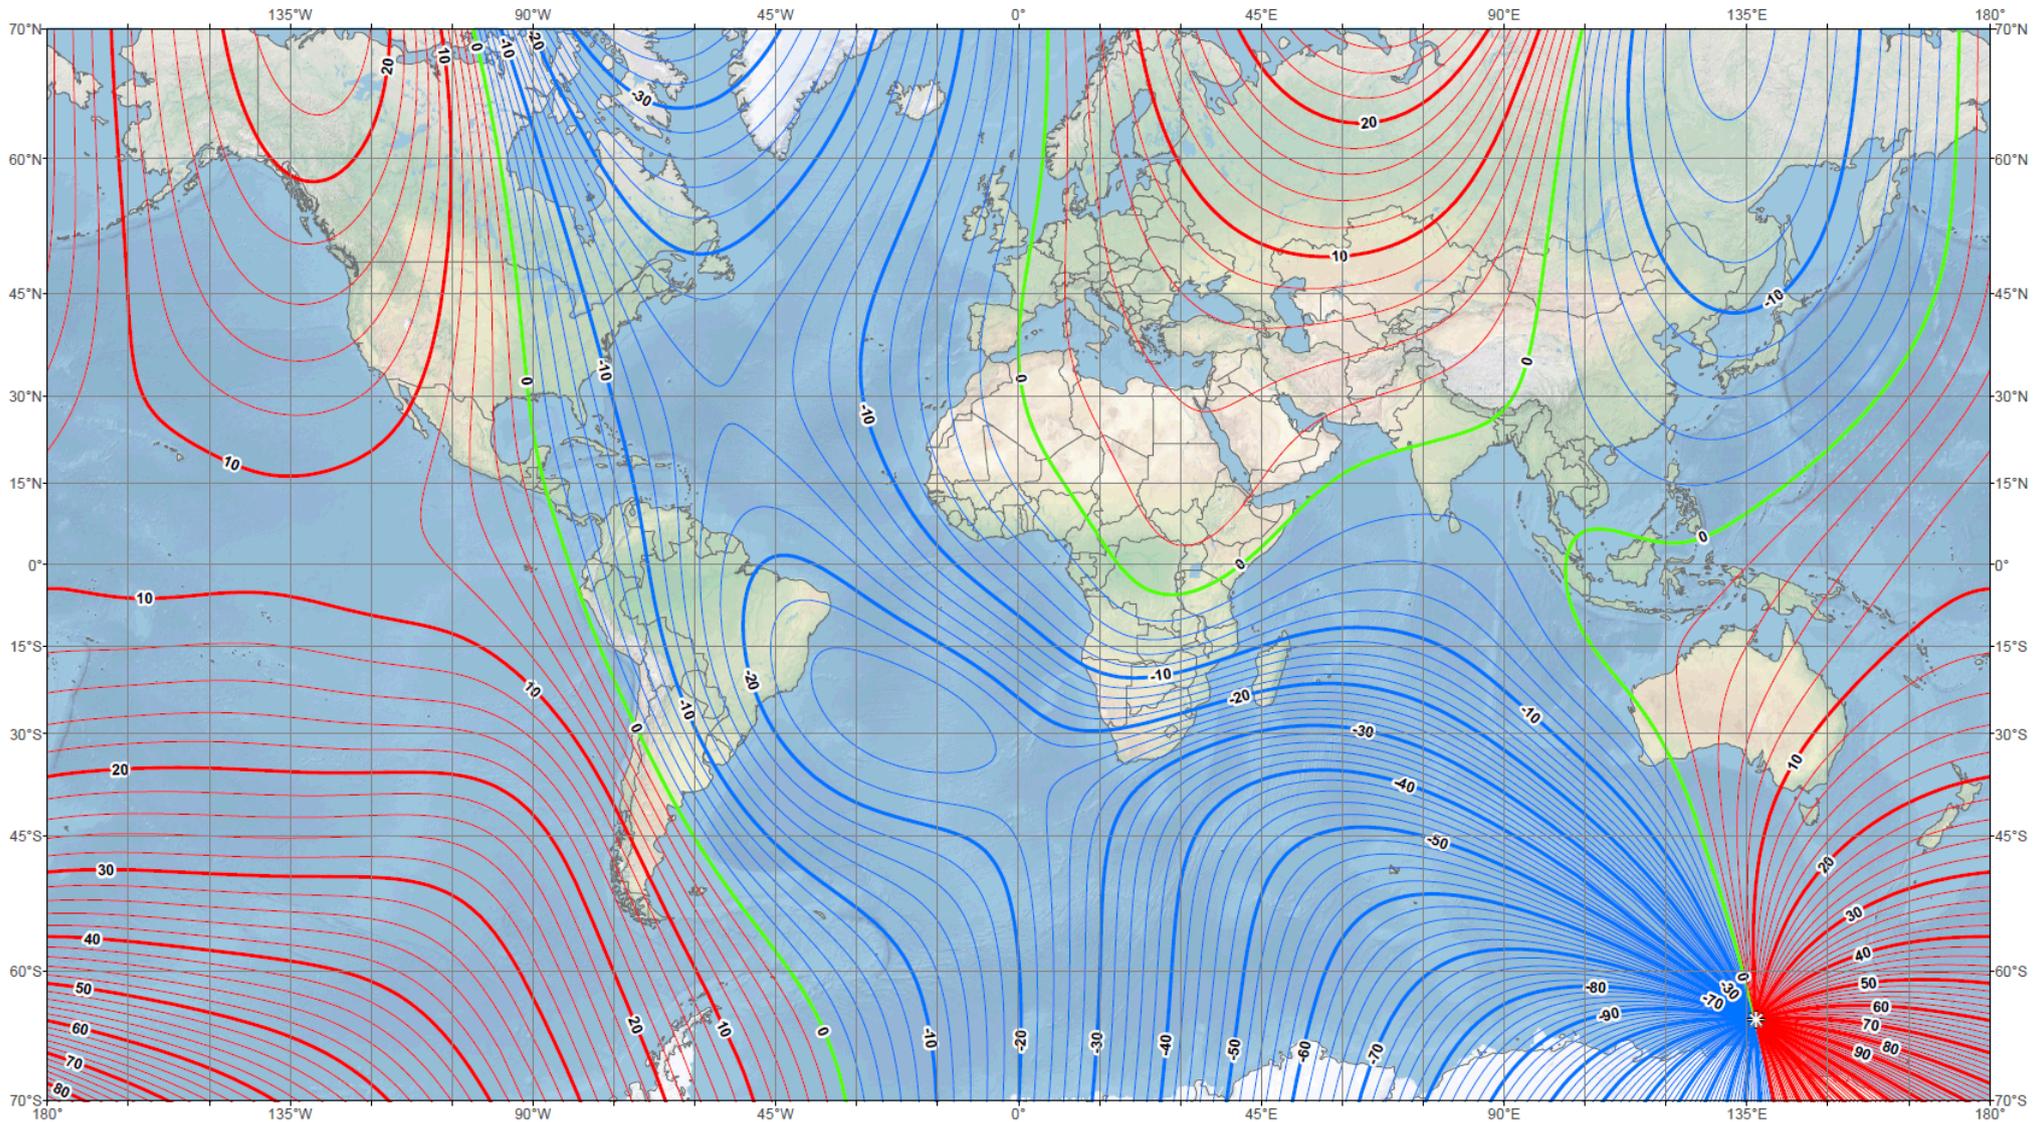

The geomagnetic field can be described at any given location on the surface of the Earth by two components.

- The vertical component (called the “dip”)
- The horizontal component (called the “declination” by land-lubbers, and called the “variation” by sailors).

Because of the dip, a compass needs to be kept level to give accurate readings.

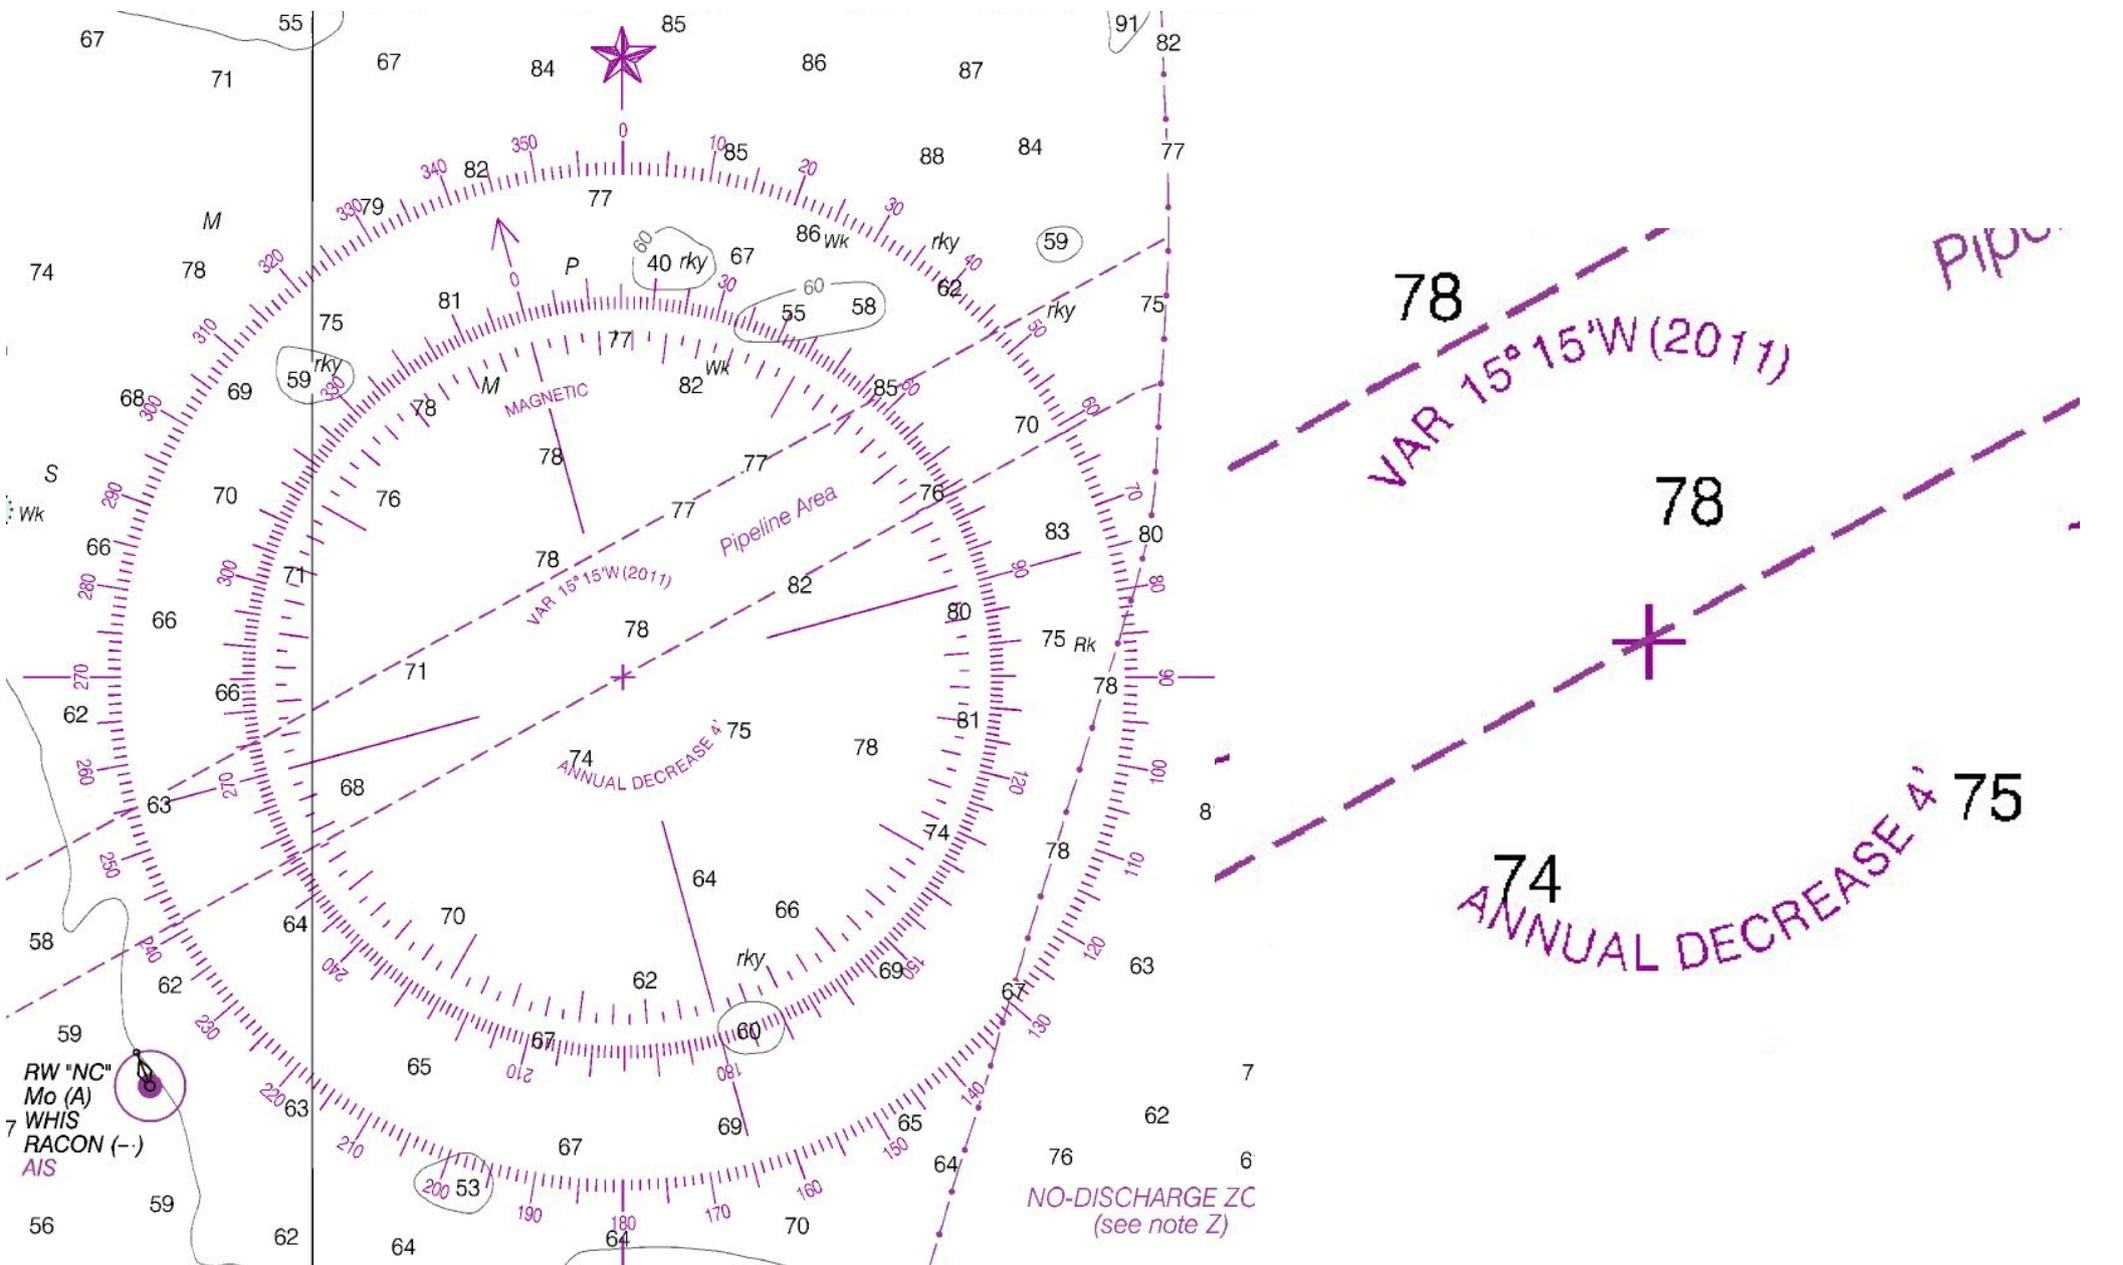

The Earth's Magnetic Field

US/UK World Magnetic Model - Epoch 2015.0 Main Field Declination (D)

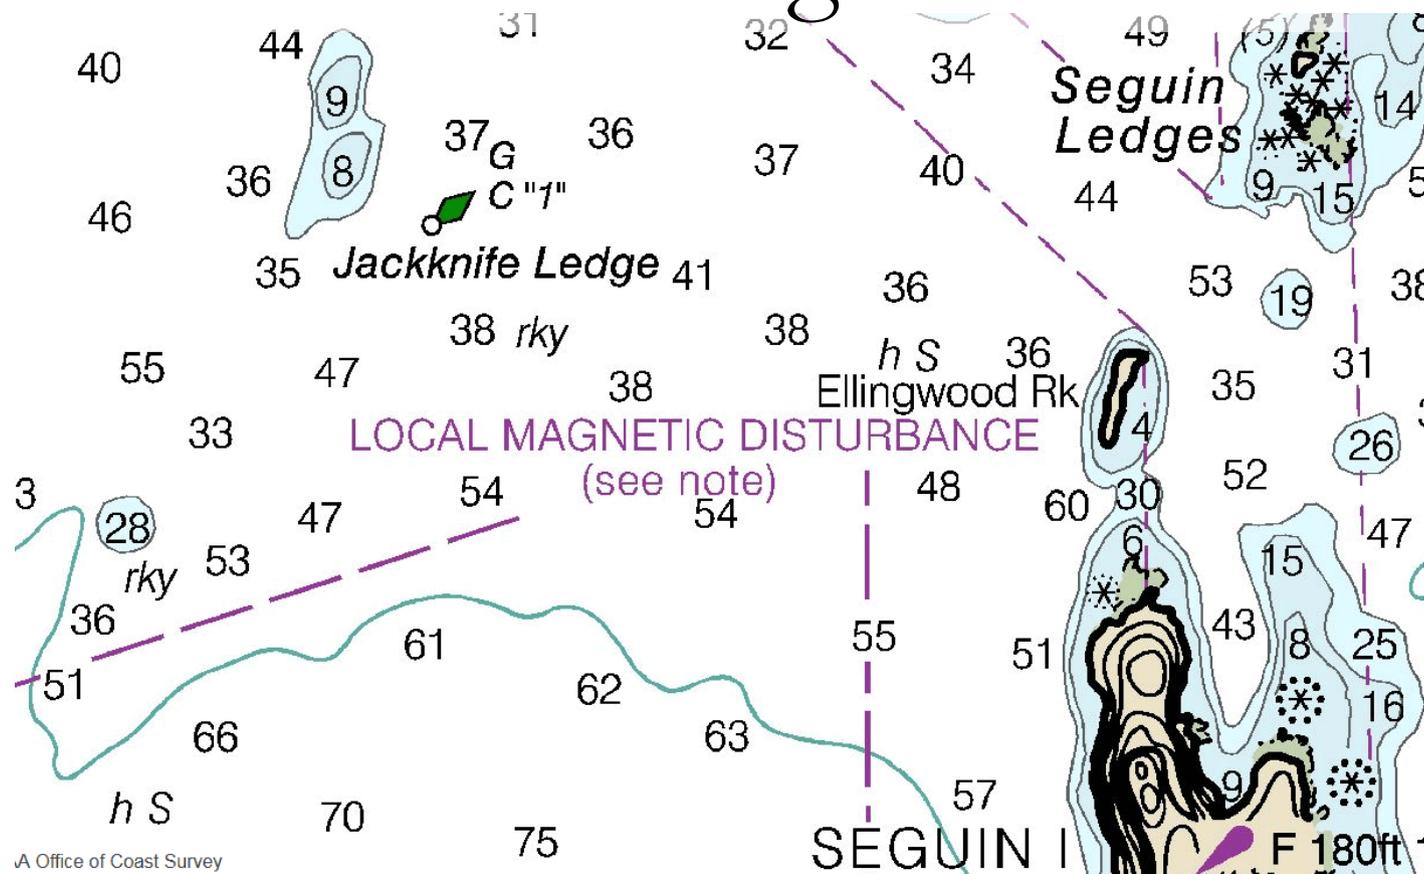

Compass Rose

Outside ring: True, Inside ring: Magnetic

The Earth's Magnetic Field

LOCAL MAGNETIC DISTURBANCE

Differences of as much as 8° from the normal variation have been observed in an area around Ellingwood Rock for approximately 1 nautical mile in all directions.

Magnetic Variation

Magnetic *variation* is the difference between a “true” direction and a “magnetic” direction (that which would be read from an ideal compass).

- Can be determined from compass rose on chart
- Can be calculated by a computer (GPS)
- Can be looked up in a variety of locations.

Bearings, courses and headings always need to be specified whether they are “true” or “magnetic”.

Magnetic Deviation

Magnetic *deviation* is the error in the compass reading caused by nearby magnetic field sources:

- Electric currents in nearby wires
- Nearby steel or other ferrous metals
- Nearby magnets (speakers, magnetized metal, etc).

Deviation is a function of the direction the compass is pointing. Each compass on each boat will have a slightly different deviation function.

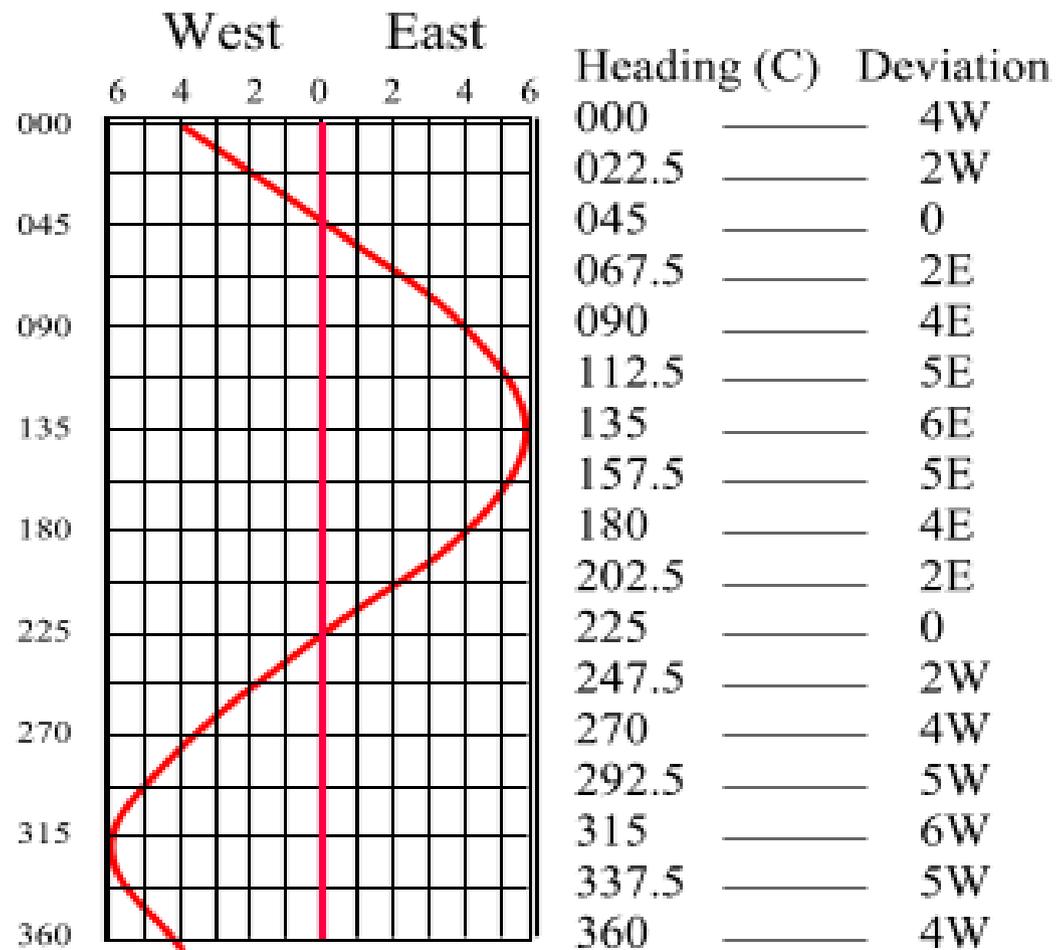

Magnetic Deviation

To determine deviation of a ship's compass:

- Point the boat in a known heading (!)
- Take a compass reading
- Correct for magnetic variation
- Write down the difference
- Repeat for several different headings
- Plot the results on a graph
- Create a table of deviations for each heading

Magnetic Deviation

A Deviation Table

Compass Heading Correction

Can	Compass
Dead	Deviation
Men	Magnetic
Vote	Variation
Twice?	True

(at Elections)	(add East)
----------------	------------

Compass Heading Correction
